The topic of beacon messages and CW ID's provoked a good discussion. Since the FCC has dropped the CW ID requirement for users, it was decided that we should recommend that ALL stations cease CW ID ASAP. There was some discussion (and an action item to review the FCC rules) to see if dedicated digipeaters really had to have CW ID's -- after all, their call is emplanted in each and every digipeated packet (albeit in HDLC). It was also agreed that all user beacons be discouraged except for PBBS/Gateways who need to send "Mail for:..." beacon messages periodically. It was further agreed that there is no need for digipeaters to send beacon messages at all.

A lot of hope was expressed that we soon begin implementing 220 MHz (or higher) links for the "backbone" communications. The long-haul links could profit from not having to contend with local area users and also from higher speed data transmissions.

All in all, it was a great way to spend a sunny Sunday afternoon. All agreed that it was well worth the 50-100 mile trip to get together and plan to do it again after the new year.

C2970 CC9 Tom Clark (W3IWI,2976) 11/27/84 11:36 PM L:35
KEYS:/PBBS LINKING/W0RLI KUDOS/

This is an unsolicited "attaboy" kudo for Hank Oredson, W0RLI. Most

of you know that Hank has taken on the task of writing a super packet bulletin board system (PBBS) which runs on a virgin Xerox 820 equipped with 8" disks with a TAPR TNC.

In the MD/DC/VA/NJ/PA area, we have 3 of RLI's PBBS on the air. Mine was the first (September) followed a few weeks later by Jon, WB2MNF (Philly/Camden area) and most recently by my neighbor Dick, KS3Q (who provides backup support for me when I have to be out of town).

Hank's latest software (release 7.2) is SUPER !!! In release 6.x Hank added a double TNC gateway capability (W0RLI and K7PYK have used the gateway extensively). After Jon and I got release 6.2 on, we realized the need to be able to forward messages between our PBBS's. After on-the-air discussions with Jon, he wrote a note to Hank which I forwarded via EIES after adding some additional comments. Jon's suggestion was for a scheme which would permit scheduled linking between PBBS's. During the time this link is enabled, all messages addressed to users of the other PBBS would be automatically forwarded (each PBBS would maintain a list of the other PBBS's users).

Last week (about 2 weeks after sending him our request) Hank told me via EIES that he had implemented our suggestions and a disk was in the mail. WB2MNF and I put the new system on the air over the weekend and it works!!! The W3IWI/WB2MNF/KS3Q PBBS (ab)users are enthralled!

Therefore thru the PBBS channels we now have a real network being built. Hank's scheme will work over any number of hops providing that each node knows the routing to the next node for each possible user. Thus if I were to send a message to W1AW and knew that a route via PBBS's A,B,C and D would get it there, and providing that A shows W1AW in his B user list, B shows W1AW in his C user list, etc, then the message will be forwarded completely automatically. We have already tried some triple links between Jon, Dick and I.

For those of you who want to get a PBBS on the air with no hassle and little cost, contact W0RLI (yes, he is on EIES) -- I think you will be as impressed as we are.

Thanks, Hank -- keep up the good work!

RE: Meaning of DTMF

I thought DTMF meant 'Dual Tone Multi-Frequency'. Contrary to popular usage, TOUCH-TONE and DTMF are not the same. TOUCH-TONE is what the keypad on your telephone produces. DTMF is used for sending call information from one central office to another.

I guess, since DTMF is used (incorrectly) so frequently to mean TOUCH-TONE, that DTMF will become another Q-tip or Kleenix.

By the way, the tones used for DTMF are not the same as the tones generated by your telephone 'dial'. (Check with you local phone-phreak)

RE: net.rec.rc

I would like to see a group for r/c people, but I would not like to lose contact with the radio/electronic aspects of r/c.

Packet radio repeaters provide multiple 1200 baud virtual-channel data links between any two points within radio range simultaneously on a single frequency pair. If one end were connected to the Vax, the other end could be us with our 2-meter radios connected to our RS232C terminals by a packet assembler/disassembler. This would be preferable to the dial-up ports

since 1) several users could use the remote radio link simultaneously, 2) our home telephones wouldn't be tied up while we're on-line, 3) the valuable Vax dial-ups wouldn't be used by us, 4) it wouldn't be as necessary to log off if we were going to be idle for a few minutes since we are consuming merely a virtual channel, and 5) we could be on-line anywhere in the city, such as our vehicles, as long as we're in range of the repeater. The drawback (if you can call it that) is one would have to have an amateur radio license, class Technician or above, to utilize this radio link.

Does anyone know if it would be legal to use 2-meters or any ham band for this purpose? Ruling out business Vaxs, academic 4.2bsd Vaxs cannot be used for profitable purposes according to the Berkeley license agreement, so does this open the door for the above type of arrangement? Unfortunately, the telephone company has only business tariffs for their data links, so the opinion within Bell anyway is that any type of data communications traffic is business. I sure hope the FCC doesn't feel the same way! Please respond if you have any ideas or information.

Pete --

Here's a brief explanation of PL and CTCSS.

First of all, they are one in the same. CTCSS stands for 'Continuous Tone Coded Squelch System'. PL stands for 'Private Line' and is a registered

trademark of Motorola, Inc. Another name commonly used is 'Channel Guard'
which is a General Electric trademark.

Now for the technical details (I'll use the term PL 'cause it's short!) --

Basically PL is nothing more than a sub-audible, low amplitude tone that
is transmitted along with the normal speech audio. When heard by a receiver
that is equipped with a PL decoder, the sub-audible tone will be detected
and the receivers' audio output stage will be activated. If the transmitted
signal does not contain the proper PL tone (there are 37 of them), the
receiver squelch won't open, hence no audio thruogh the speaker. This
scheme is primarily used by commercial two-way and public service radio
services, and in fact is required by the FCC in those applications. PL is in
use by amateurs in the US to a small degree, mostly on repeaters in the 440-
450 MHz band to alleviate intermodulation problems. In commercial applications
another advantage is that a large number of users, i.e., Joe's Plumbing,
Speedy Courier, and Pink & Green Taxicab, can all share the same frequency
(repeater) with each using a different PL tone. With this scheme, Joe's base
station and his fleet of plumbing trucks will only hear calls from each
other and not be bothered by the other users of the repeater.
There are some details of actual operation that I
have not gone into here, but they are not really necessary in this basic
outline.

Hope this has helped.

CTCSS  -  Continous Tone Coded Squelch System

DTMF  -  Dual Tone Multiple Frequency (touch tones, telephone-like)

PL  -  Private Line (Motorola's name for CTCSS)

Note -  CTCSS for General Electric is called "CG" or Channel Guard
        and RCA calls it "QC" or Quiet Channel.   All the same thing.

I am considering building a quad antenna, and I have some questions I would like to ask the net:

- Where can I get fiberglass spreaders, and are they worth the extra expense over bamboo?

- I am considering mounting the antenna on a tripod on the roof of my two story house. What is a good tripod-rotator combination? I would like to locate the rotator below the top of the tripod to keep some of the stress off it.

- I can get a 2-element boomless spider locally. Are boomless quads sturdy?

- I am interested in anyones experience with quad construction, and the performance of the antenna.

- I hope to make a tri-bander, so I am interested in feed methods too.

I will appreciate your help. Please reply by mail, and I will post a follow-up article if there is interest.

Thanks in advance,
Robert T. Neece N4JEO

If the VOX switch is off and it does it, it's broken just like mine! Yaesu service center in California has had it once and didn't fix the problem so it's going back via UPS tomorrow (10/19/84) to give them another shot at it. If it's repaired when it comes back this time, I'll post the fix to the net. Aside from this annoying problem, the radio seems to do a pretty good job.

The problem that would create is that of security. Your password
could be picked out and/or any other "secure" information could
be obtained by any station in "watch all" mode. I had thought
of a gunplexer link between Purdue ECN systems and my home, as
they are quite directional and much less likely to be heard, but
still far from secure. I had thought of a scheme that you would
have a list of passwords, such that it would move to the next
password in the list after each login, but that would be pretty
kludgy, not to mention inefficient. If you attempted to use
an encryption scheme that wouldn't be legal for amateur radio.
Might be a neat idea for a public domain bull board though.

DTMF, as a term, could apply to both the long distance trunk control codes
as well as your local Touch-Tone (tm) telephone. But I seem to remember
seeing a document that called the long distance tones something else, and
relegated DTMF to the generic term. It was in a magazine called
Telephone Electronics Line or TEL for short. It was a shortlived
publication in the early 70's. Probably had something to due with the
fact that they published an article comparing the "new" proposed
digital control system to the DTMF control system, complete with
all frequencies, digital codes, and operator control codes.

**** UoSAT Bulletin-97 (Edited) 19th October 1984 ****

UoSAT Spacecraft Control Centre,   University of Surrey

** UoSAT-Oscar-9 Schedule **

This weeks schedule is as follows:
    Friday   - load Bulletin
    Saturday - Bulletin/DIGITALKER/1200 bps telemetry
    Sunday   - Bulletin/DIGITALKER/1200 bps telemetry
    Monday   - Bulletin/DIGITALKER/1200 bps telemetry
    Tuesday   - CCD Camera - next week Radiation data
    Wednesday - Whole orbit telemetry survey

Thursday - Computer check-summed telemetry

The 21 MHz Beacon will be in use this week.

** UoSAT-Oscar-11 Operations **

* Telemetry Channel No.13 *

The Telemetry Channel 13, which has previously been labelled as 'spare', has now been named and calibrated as:
13 435 MHz Downlink Transmitter VCO Control Voltage
(V = N/20)

This channel was kept free right up until final s/c checkout just in case there were any last minute demands, but none arose and it was allocated to the default - monitoring the 435 MHz transmitter VCO control voltage. Stored telemetry from the OBC has enabled us to confirm the allocation and its calibration.

* The 435 MHz downlink is functioning well with an output rf power of 1 watt, consuming 225 mA from the +14v unregulated bus.

* Experiments continue with the 9600 bps nrzi psk data on the 435 MHz downlink in preparation for DCE, CCD & Particle/Wave Experiments. The tests this week focussed on calibration of the modulation index and evaluation of a i.f. demodulator/decoder. The preliminary results look very encouraging, but more work needs still to be done before we feel happy about releasing all the details - we don't want to send you all on wild goose chases!

* Particle/Wave Experiments - UO-11 and the AMPTE spacecraft will be in conjunction for a couple of weeks around the beginning of November allowing the simultaneous measurement of P/W interactions with UO-11 and UKS. Preliminary tests were carried out on Monday 081084 to evaluate the P/W experiment and later analysis has shown it to have been most successful. These conjunctions occur only once every six months so we must get going! More details will be given soon.

* The spacecraft Z-spin rate continues to increase slowly of its own accord, due to cross-coupling of the libration energy into rotational energy, and de-spin manoeuvres have continued this week to keep the Z-spin rate slower than about 2 minutes per revolution - it seems that we need to despin about once every 5 days -

A daily account of UO-11 operations follows:

DAY	ORBIT	CHANNELS	RESET TIME
***	*****	********	**********

```
Saturday    whole orbit data & telemetry

Sunday      3310      1,2,3,52       08:54:47

The MARCE 007 STS-41G canister was removed from the shuttle cargo bay and checked
at KSC today. When power was applied the experime
nt came on and everything indicated nominal. Ed Stluka informed ARRL that it
appears there was an in-flight power up anomaly. This
 is good news because if further checks give the experiment in the canister a
clean bill of health there will be a possibility of a
future re-flight.
The Goddard Space Flight Center was assigned the task of finding the cause of the
power-up anomaly. The power up readings at turn o
n today were: Time 0000, Status 18, T1 081, T2 082, T3 082, T4 083, T5 082, T6
081, V1 202, I 023, P 247. All readings nominal.
During flight the APC controller was programed to turn the A, B and C relays ON.
Lights on the controller indicated that all relays
 had closed. At the end of the experiment period the APC controller was programed
to turn the relays off but it indicated that the
relays were already OFF. Kathryn Sullivan noted the anomaly in her in-flight log.
More news will be carried on the AMSAT nets and W1AW bulletins.

The password problem is a bit awkward but you should be able to circumvent
it by having the machine transmit a 'challenge' sequence to you which you
have to mangle in some specified way and send back. Since you are the only one
who knows how to mangle the sequence correctly it should be secure. But this
does not solve the problem of anyone being able to watch your entire session.
I assume that anything related to work that is done using amateur frequencies
would be illegal but how about doing an assignment? For that matter, would
it be illegal to do ham-related work (e.g. compute predictions for oscar-10)
on an amateur radio link into a machine for which you are paying commercial
rates for cpu time etc.?

qst de k9eui
hr dx bulletin nr 38 from arrl headquarters
newington ct october 19, 1984
to all radio amateurs bt

thanks to k1xm, k1mm, w1trc and the southern new england dx association for the following dx information.

wallis and futuna. fw0bx, ron, has been active on 160 through 10 meters, both cw and ssb, operating around 21028 khz from 2130 to 2230z, on 14026 khz at 0200z, 7004 khz at 0900z, 3505 khz at 0700z, 3795 khz at 1130z and on 160 meters at 1030z. qsls go to zl1amo.

hong kong. vs6do has been active most days on 40 meters at 1000z on 7004 khz. qsl k4cia.

new caledonia. fk8ff, guy, has been active 0n 7009 khz at 1000z.

tuvalu. t2ade has been on 75 meters at 3795 khz at 1000z.

st. helena. zd7cw has been on 3798 khz at 0000z.

san felix. ce0aa continues to be active on most bands and is planning to spend october 21 through 25 on 10 meter cw exclusively.

crozet. fb8wk is still active frequently around 7008 to 7010 khz at 0300z. fb8wj and fb8wk will be leaving at the end of this month.

svalbard. jw0eq has been very active working the u.s. from 0100 to 0200z on 7004 khz.

mellish reef. operation is expected to take place from october 25 to november 6 on all bands, 160 through 10 meters under the call vk9mr. qsls go via vk2wu.

haiti. hh2vp, vic, will be in haiti for two more months. he has been active on 40 and 20 meter cw. qsl to w1fj. hh2mc has been worked on 3795 khz at 0230z ar

I too have been thinking a lot about using packet radio for high speed
remote access to a Unix system. The problem of broadcasting your Unix
password all over two meters is a real one, but there are ways the
problem could be solved with public key cryptosystems. The current
sentiment among the legal eagles is that such a scheme would NOT violate
the prohibition against "codes and ciphers" in the amateur service
because it is intended as a authentication scheme and not to hide
information. There is ample precedent for authentication schemes, e.g.,
repeater autopatch and control codes.

The regular traffic would still have to be transmitted in the clear, of
course, and this would provide "spoofing" opportunities for a bad guy.
It would only take one spurious packet of the form "rm -rf *"
from some clown and even though the protocol might recover from the
unsolicited acknowledgement, the higher-level damage would obviously be done.
About the only thing that could prevent this would be a public key
authentication scheme on each and every packet.

Another clever (non-encryption) scheme for protecting radio communications
links is in use by the military. It works on the fact that the atmosphere
has widely varying attenuation with frequency, and in particular at
frequencies near 60 GHz the atmosphere is virtually opaque due to oxygen
absorption lines. Secure point-to-point radio systems use frequency-agile
transmitters which operate as high up on this absorption curve as possible
while still being received at the intended recipient. If an enemy tries
to intercept the beam somewhere farther along, atmospheric noise
and attenuation will make the signal useless.

You're probably best off using a laser (infrared, so to not attract
attention.) It has the additional advantage of not needing a license,
and not being subject to the amateur rule restrictions against business use.

Phil

Subject: Lauren's comments on Wayne Green.

100% agreement!!!! If there has ever been a force to destroy ham radio
it's good 'ol Wayne Green. All he is interested in is furthering his own
interests, which boil down to RTTY, himself and money (but not in that order).
The entire 'no-code' effort that he has been pushing was pretty well doomed
to failure because it attacked CW and CW operators rather than attempting
to boost a vhf-and-above license. If his efforts were directed at showing
the value of having a vhf license and then arguing that there was no need
for a code test for that license then he would have won. But he has done
many amateurs and prospective amateurs a huge disservice. And I would
write and tell him so except that he can't read letters that disagree
with him.

    Of all the mail I've received on this idea, by far the most limiting
aspect is the password broadcast. Perhaps a landline could be dedicated to
receiving calls from people wishing to connect, and their password could be
dialed from their pushbutton phone. Of course, this begins to limit the

usuablitiy of the system. Disposable passwords or passwords which are a function of some variables known only by the user (such as time of day, number of times logged on, etc) is the only alternative.

Leaky CATV Equipment Interferes With Scanner User

A non-ham scanner friend from Westmont (Illinois) related this tale of grief caused by CATV signals (he is not a CATV subscriber):

> "In August 1984, a storm dropped several heavy branches onto the cable trunk line in my alley. New York channel 9 appeared on my channel 4. The UHF Atlanta superstation came in on channel 13. Manipulating the tuner controls on my (35 channel) cable ready VCR brought in HBO, Showtime, Cable News Network and other cable services with varying levels of snow and intermod. Worse yet, regular Chicago stations now had a ghost caused by the cable retransmission being microwaved around first thus being rebroadcast milliseconds behind the direct receptions. Finally, my scanner was being jammed all over the spectrum."
>
> "A call to the FCC brought a 'don't disturb my bureaucratic games, what do you want me to do, be a public servant?' attitude. I called the FAA as they have a remote control sight at nearby Downers Grove/Woodridge in case their system was getting interference. A call to the local cable company office confirmed my suspicion that employees were never trained about a closed circuit 'broadcasting'. Besides, a service call was rejected by their computer because I was not a subscriber."
>
> "I located the regional cable company office in a city it did not serve. From their operator, I found out the name of the Chief Engineer who did not return my call. I sent a certified letter to him citing chapter and paragraph of the FCC regulations. I established my right as a user of the electromagnetic spectrum as a broadcast watcher (scanner owners have no rights as

they are not the intended recipient normally) that could not watch non-local stations anymore as well as having regular channels ghosted..... That [registered letter] brought results, a call from the Construction and Repair Chief besides the Chief Engineer."

"I had prepared for this by walking several blocks in all directions with a portable scanner to find the point of highest signal strength. The cable company's sweeps were inconclusive because they used a wide band measuring device. Thus, they measured up to 6 MHz of a public safety/business band spectrum. About 100 police and fire departments and 1000 business users masked any meaningful meter reading. After replacing first the connectors, then the 4-drop couple and finally a 500 foot section of trunk cable, the interference cleared up."

"A nearby ham continued to suffer interference however. He is a subscriber" and "had added a section of coaxial cable to the cable connecting his TV set with his VCR. That cable purchased at a handy neighborhood national electronics chain store.....did not have a 100% shield...." [so it allowed CATV signals to radiate around his own house].

The amateur radio service exists for several reasons:

- Establishment of a group of trained radio operators to facilitate communications during emergencies. (Public service type stuff)

- To advance the state of radio technology.

- To promote goodwill between amateurs of other nations. (DX work)

et al.

It seems to me that accessing a computer, via the ham bands, to do YOUR work on is not a valid use of amateur radio. FCC laws forbid one way broadcasting except for news of interest to all amateurs and code practice. I suppose you could consider a session with a machine some form of two-way communications, but I think this would be streching the spirit of amateur radio.

<all of the above is my personal opinion only>

TNX, 73 Rob Paull (KA6SFV)

PS: Why don't you get the FCC to give you a piece of unused spectrum and you could set up a business renting portable wireless terminals and computer time.

Regarding leaky CATV systems...I have an item which should appear in QST
Hints & Kinks soon about a way of locating it.

A 2-meter SSB receiver is about the most sensitive device I know of for
detecting CATV leakage. I also found that the doppler shift caused by
vehicle motion is quite readily apparent on a mobile SSB transceiver
as you drive past the offending spot. Finally! A practical use
for all that Relativity Physics you learned in school.

Has anyone heard of a fix for the TAPR TNC lockup problem whereby the board
locks up when used in converse mode? A friend has one and the lockup is
occurring more and more frequently to the point that he can rarely transmit
any text now. He is using Version 3.0 and his board is SN #286.
Please mail replies to me at ihnp4!sask!hardie.

I don't think an encryption of your password would be illegal. As long as you ID'd yourself unencrypted anything else could be considered your "data" and as such wouldn't have to be in english. Besides, you don't want to have a password scheme on a radio system. You'd want a system that was interactive. The host would send a data stream to the terminal, the terminal would transform the data stream by an equation or algorithm that is unique to that terminal and known only to the terminal and the host, then transmit the modified data back to the host. The host would then check to see if it was the correct transformation. By using short data streams with complex algorithms the code would be virtually unbreakable. You could even have it "re-id" anytime the link is brought back from an idle state of say more than 2 minutes, and in any case, every few exchanges.

I think the only legal issue is the business use. You could use it for "notes", personal mail, and "home"projects but that would be it.

FYI - The ARPANET-USENET gateway for net.ham-radio is broken at the moment. I am manually forwarding USENET-originated traffic to Info-Hams-Request at host Simtel20 as I can, but movement in the other direction doesn't seem to be feasible until the gateway is fixed. I believe that this breakage has also affected other lists, like Info-Micro, Info-CPM, and Info-UNIX, and their respective USENET counterparts. This seems to be due to problems at SRI-UNIX. Any fixes would be appreciated.

It seems that every time Glenn Hauser announces some change or revision in the World of Radio broadcast schedule, and I post it on the net, it gets changed again, or changed back, during the following week. So it is yet again! The following applies to the broadcasts via WRNO shortwave:

The previously-announced plan to move the (US time) Saturday evening broadcast to Friday evening, to avoid pre-emption by football, has been cancelled, due to WRNO's decision. Don't know why.

Here is the new schedule, effective 28 October with the change back to Standard Time. The World of Radio broadcasts will stay the same local time, but shift in GMT due to this change.

0530 GMT Saturdays (11:30 PM Fridays Central Time) on 6185 kHz

0230 GMT Sundays (8:30 PM Saturdays Central Time) on 7355 kHz

1400 GMT Sundays (8:00 AM Sundays Central Time) on 11965 kHz

Note that the broadcasts on 26/27 October will be on at the same local
time as listed, but one hour earlier by GMT, as the time will not have
changed yet. The 0230 GMT Sunday broadcast will probably be pre-empted
by football most weekends while the season drags on...

Regarding the legality of using ham radio to access your computer, this
would be a problem only if it was a "business use" of amateur radio. As
long as you're not doing work for which you are paid (or facilitating a
company's business), use of packet radio for remote computer access is
not only legal, it is encouraged. At this stage of the game, it certainly
falls under "advancing the state of radio technology", something that the
vast majority of (American, at least) amateurs seem uninterested in as
proven by their reaction to the no-code docket.

Here is a quote from 97.69:

"...an amateur radio communication may include digital codes which represent
alphanumeric characters, analogue measurements or other information.
These digital codes may be used for such communications as (but not limited
to) radio teleprinter, voice, facsimile, television, models and other
objects, transference of computer programs or direct computer-to-computer
communcations, and communications in various types of data networks
(including so-called "packet switching" systems); provided that such digital
codes are not intended to obscure the meaning of, but are only to facilitate,
the communications..." [goes on to describe transmission standards]

The only remaining legal grey area has to do with whether amateur packet
stations can be unattended. We have at least temporaily avoided
this problem by considering them to be repeaters (by placing them
within the repeater segments) and then using the "automatic control"

repeater provisions.

qst de k9eui
hr propagation forecast bulletin nr 43 from arrl headquarters
newington ct october 22 1984
to all radio amateurs bt

it would not have been front page news a few months ago, but substantial sunspot activity appearing on the eastern portion of the sun october 15 and 16 was welcome, indeed. for a few days, something more than north south dx was available on 28 mhz, for the first time since last spring, and 21 mhz was active almost worldwide for several days. then the flux fell back to 74, and action on both bands tapered off.

as usually happens, the solar outburst was followed in two days by rising geomagnetic activity, which tended to knock out propagation in the higher latitudes. cconditions for the forecast week are likely to be no better than fair in this respect, through the 23rd. solar flux values are expected to remain in the low seventies through about the 28th, but conditions will be improving after the 24th. a small solar flux rise is likely at the months end, with a move toward higher muf through about november 2. in general, november is expected to bring slightly better conditions than october has up to this bulletin issue date.

american sunspot numbers for october 11 through 17 were between 0 and 22 with a mean of 10.0. ar

There was a problem in the earlier versions of TAPR code in which the board would crash whenever it received a frame with an excessive (> 3) number of digipeaters. The latest version of code (I'll have to go check the version number) seems quite robust; I've had it running for many months now with the only crashes due to things like power failures.

I am trying to ascertain whether to purchase a kenwood 2600 HT. Previously, I have tended to stick with ICOM equipment and have found it work well, but I am intrigued about the 2600 DCS (digital controlled squelch) feature. My wife and I live in a situation where we have no phone and it would seem that DCS could be just the ticket for us to be able to communicate without one or the other of us having to monitor through bunches of unrelated chatter on the repeater. I myself have not been very active (up to now) on 2 meters, but a contact of mine pointed out the following two drawbacks with DCS.

(1) The tone burst which preceeds each transmission to open the squelch of the "target" receiver bothers other hams on the repeater.

(2) Many repeaters don't pull in fast enough. This results in the leading part of the tone burst getting dropped by the repeater thereby corrupting the code. This could be overcome by keying the repeater (without DCS on) to bring it up, then enabling DCS and re-keying to send the tone burst.

And now for the questions:

* Does a DCS tone burst really sound that obnoxious?

* Has anyone used the 2600 DCS and found drawback (2) to be the case?

* If so, how have you worked around it?

* Is there any way of delaying the tone burst after the HT is keyed to allow for the turn-on delay of a typical repeater?

TRICK FOR OUT OF BAND RECEPTION ON UHF RECEIVERS

Articles in "Monitoring Times" and "Popular Communications" have described how one may "trick" various scanner radios into receiving frequencies that they were not designed to receive. These tricks fell into 2 categories:

1. Tricking the microprocessor-based control element by making use of some bug in the firmware.

2. Listening to simple images (e.g. to listen to fre-
quency F, tune the radio to F + 2 * [the intermediate frequency]).

This article describes a third technique, which I discovered by accident.

My Radio Shack PRO30 scanner (10.7 MHz intermediate frequency) can receive the audio from TV channel 44 (655.75 MHz) when the radio is programmed for 510.4875 MHz.

I think this is what's happening:

- When the radio is set to 510.4875 MHz, the local oscillator is working at 510.4875 - 10.7 = 499.7875 MHz.

- This 499.7875 MHz signal is actually the output of a frequency tripler, whose input frequency is 166.5958 MHz (approx).

- In addition to this 3rd harmonic, there seems to be a 4th harmonic component present (666.3833 MHz), which when mixed with a signal on 655.6833 MHz, produces a 10.7 MHz IF (655.6833 MHz is close enough to ch 44's
  655.75 MHz)!

Owners of the Bearcat BC100 handheld scanner (10.8 MHz IF) have told me they can receive UHF TV signals on odd frequencies also. After checking the arithmetic, I've concluded that they are experiencing the same phenomena.

Here's the algorithm: to listen on an out-of-band UHF frequency U (in MHz), try tuning your radio to:

   [3*U - 7*(intermediate freq in MHz)] / 4

Conversely, if you hear a strange signal when your UHF radio is tuned to T MHz, you may be simultaneously listening to the frequency of:

   [4*T - 7*(intermediate freq in MHz)] / 3

I would be interested in hearing from those that have tried this on amateur 440 MHz receivers, or on other radios.

RE "Unused Spectrum":

There is no such thing as "unused spectrum" in the practical frequency bands.
About the only thing available is line-of-sight 23 Ghz microwave...

We have begged, pleaded, and threatened the FCC for an HF, VHF, or UHF frequency
for local packet, and the only response is for all members "to get their
amateur licenses."

If anyone can find an available frequency band and service, PLEASE let me know!

Charles J. Lord

x
THE "NEW" REGENCY SCANNERS - 1 YEAR LATER

On June 23, 1983, I posted an article describing some of the new scanners Regency announced. Here's an update:

- The HX1000 was supposed to be a 20 channel portable. The real HX1000 just became available a couple of months ago. It is built in the same case as the Azden 2m walkie-talkie, and contains 30 channels, not 20. The factory spec sheet boasted 2 watts of audio output, but the real HX1000 has only 0.2 watts! The two HX1000's my friends own have very good sensitivity.

  This unit being sold now at the Downers Grove (IL)
  McDade store! Regency doesn't have the facilities to

repair the HX1000 yet, so they are giving customers brand new ones in exchange for units sent in for repair under warrantee!

- The MX5000, a 20 channel scanner with continuous 25-550 MHz coverage, has become available during the last few months. It is built in Japan by AOR, the same company that produces the Tempo S5 walkie-talkie.

  Users appear happy with the good sensitivity and wide coverage, but the scanning rate comes nowhere near meeting advertised claims. To quote a recent "Monitoring Times" article: "The SLOW scan and search rate (11 seconds for 20 channels) earns the unit its first design Edsel. it's ridiculous, unnecessary and totally useless."

  Its high level of internally generated noise wipes out reception when using the supplied antenna: "on frequencies below 300 MHz - especially between 25 and 88 MHz - you'll find the unit almost unusable on this antenna."

- The MX7000, the first programmable scanner to cover the 800 MHz band is STILL not available. Current speculation is that this radio is really a Japanese MX-5000 with the additional 800 MHz converter components stuffed on the board. The factory spec sheet showed a completely different scanner (likely an early mockup of what was supposed to be an American built radio).

My son, who is a Junior in CS at a school not on the net, is interested in learning electronics without going back to ground zero with engineering courses. He has asked me to recommend a/some book/s in the hope he could pick things up for himself.
I have always felt that the presentation of basics in "The Radio Amateur's Handbook" was one of the best I had ever seen. It has, however, been over 10 years since I last saw one and they are temporarily out of stock everywhere local pending a new issue.
Do you folks agree with me?
Would you recommend something else as a starter?
Heathkit has a lot of very expensive courses. Anyone recommend any of them in this case?
I will be happy to summarize replies if volume and interest so indicate.
Many thanks in advance.

It's the thought,if any, that counts. Dick Grantges   hound!rfgZ

 Hi,fellow ham (or other) r/c nuts.

     Currently I am using an Airtronics XL6-FM system. (TX,RX & servos) What I'd like to know is if anyone has mixed and matched other manufacturers equipment. E.G., Airtronics with Futaba or Kraft or Ace or ???   What I'd like to do is have separate reciever/battery systems in each model to avoid pulling things apart too many times.

  Airtronics separate receivers seem to be unavailable right now, but Futaba is in ample supply. Since most of the modern systems use the Signetics

encoder/decoder chips I thought I might get a simple 2 channel receiver and
use it with the 6 channel transmitter (Thus saving lots-a-bux).

TNX 73 Rob Paull   (KA6SFV)

ps: My source for most R/C stuff is Sheldons in San Jose, CA. They seem
    to have the largest selection of hardware and software (planes Hi.Hi)

I have more fun with my TR2600A than I've had with any HT since 1970.

  >   * Does a DCS tone burst really sound that obnoxious?

Yes.

  >   * Has anyone used the 2600 DCS and found drawback (2) to be the case?
I tried using the DCS once with a friend on simplex just to see
if it worked. It did. Never tried it through a repeater, but
a digital burst is sent both at the start AND the
end of the transmission, so if the opening burst didn't make it,
the closing one will.

I'm afraid the above just isn't true. DTMF is the same as Touch-Tone (tm).
Look, for example at the EIA specification RS-470 describing Telephones.
It specifically states DTMF and gives frequencies.

The signalling method subject to being fooled by "Blue-boxes" is known
as MF. The publication which gave out the MF frequencies was apparently
hastily removed as soon as the implications were realized. These
frequencies are not produced by the DTMF or Touch-Tone (tm) pad in ones
telephone and certainly not by a dial phone !

Paul Wilcox-Baker.

Speaking of learning electronics, do not ever recommend the military
for this task. Recent graduates have what is known as the ability
to change cards. Back in the sixty's when I went through there was
substance but now only attempts to save money. That is, let the
gomer pull the card and throw it in the trash or send it back to the
manufacturer. I point this out as it used to be a desireable path.

- - - - - - NEWS FLASH - - - - - -

On October 18th, the Federal Communications Commission granted a Special Temporary Authorization (STA) permitting 21 amateurs to operate TelePorts capable of automatically relaying digital (packet radio) communications between terrestrial packet radio networks using amateur satellites.

As a first phase of the new AMSAT/ARRL TelePort STA, a unique packet radio test was carried out on Sunday, October 28. An automatic packet radio bulletin board system (PRBBS) operated by Tom Clark (W3IWI) was placed in experimental operation on the AMSAT-OSCAR-10 satellite. The W3IWI PRBBS was sucessfully used by several amateurs across the U.S. and in Canada. Earlier this year, successful PRBBS tests thru the same satellite had involved "gateway" links to existing terrestrial PRBBS systems in California.

The following stations participated in this test and successfully logged onto the W3IWI PRBBS:

Randy Smith (VE1PAC/VE6), Medley, Alberta Wes Morris (K7PYK), Scottsdale, Arizona "Mac" Jordan (W4DAQ), Demopolis, Alabama Bob Diersing (N5AHD), Corpus Christi, Texas

A number of other stations were also monitoring and reported good copy.

Both VE1PAC and K7PYK sent and received several messages and files during their connections with the PRBBS. K7PYK maintained contact for about an hour and managed to acquire about 50 kilobytes of documentation from W3IWI. W3IWI and VE1PAC tested full-duplex PRBBS

operation thru the AMSAT-OSCAR-10 satellite and achieved sustained data thruput of about one kilobaud despite the 0.25 second round-trip propagation time to the satellite.

The packet radio hardware used at W3IWI is normally used as a local area PRBBS serving Baltimore-Washington. It consists of a Xerox 820 computer running W0RLI software and a TAPR BETA TNC. The packet radio links were running at 1200 baud data speeds and used 1000 Hz shift FSK modulation generated by "202A" style modems.

Both W3IWI and N5AHD are among the 21 amateurs approved for the TelePort STA.

> ...An RC newsgroup is a good idea...

Only if it proves necessary. Look, folks, we've seen innumerable cases of "flash in the pan" newsgroups: lots of enthusiasm for their creation, lots of traffic at the start, rapid asymptotic decay to zero. While not wishing to insult the RC enthusiasts, there is no justification for an RC newsgroup until they can demonstrate sustained traffic on the subject.

We've seen a lot of "oh, wow, an RC newsgroup, how wonderful" articles...
but very little actual discussion of RC. Never mind how many people think
it's a great idea; how many of them will *participate*?

If you want to discuss RC, start discussing it. Where? Here, since it's
about the closest match of topic. The time will be ripe for a separate
RC newsgroup when (and *if*!) there's enough RC-related traffic, continuing
over a substantial period of time, that the rest of us start grumbling.
If there's never enough to make us unhappy, then there really isn't enough
to justify a separate newsgroup.

In other words, if you've got something to say, start saying it!

Thinking about buying an O2AT? Offer me the best advertised price you can
find for a new O2AT and you can have the one I purchased from EEB in July
plus a Larsen 1/4 wave mag-mount, a 30 watt linear and a homebrew DC cord.

(Please reference said ads, or, yes, I think you should buy the one
 advertised by Murray's Midnight Radio Supply for $49.95.)

(Flames about misusing net.ham-radio to /dev/null. I also enjoy the SWL
 traffic on this newsgroup.)

Wups, I hadn't noticed that my posting saying "if there's anything to
say about RC, start saying it" was going to four different newsgroups.
When I said "here is the right place", I meant net.ham-radio.

qst de k9eui
hr arrl bulletin nr 97 from arrl headquarters
newington ct october 27, 1984
to all radio amateurs bt

the arrl board of directors met in hartford, ct on october 25 and 26. highlights of the actions taken follow.

there were several actions taken pertaining to packet radio, among them the approval of the ax.25 amateur packet radio link layer protocol.

the contest advisory committee was directed to study the feasibility of a more neutral geographical scoring system for at least one of the arrl sponsored uhf vhf contests.

the general manager was directed to develop a program designed to increase the number of u.s. amateur radio licensees by 50,000 per year for the next five years, and a program to increase arrl membership by 25,000 by the end of 1985 and by approximately 20 per cent each year thereafter.

it was unanimously voted that the general manager devise and

implement procedures to permit walk in examinations at arrl (garble) volunteer examiner exam sessions, as and to the extent that the particular ve team deems appropriate.

future vhf uhf repeater directories published by the arrl will include within the directory a designation to show the difference between a repeater that has been coordinated and one that has not.

it was unanimously voted that the technical excellence award for 1983 be presented to william sabin, w0iyh, for his article in july 1983 qst.

it was unanimously voted that counsel file a request for a 45 day extension of time in which to file comments in prb 1, arrls request for issuance of declaratory ruling to establish limited federal preemption over amateur antennas and supports.

the 23 cm band plan submitted to the board by the vuac and vrac at this meeting is to be returned to those committees for further study.

the management and finance committee is to study the desirability and feasibility of relocating headquarters from newington, ct to an alternate site, such study to consider all aspects, including the need and desirability of such a move, the costs, the impact on league staff, and the degree of increased effectiveness to be gained.

," band plan as proposed the 33 cm band plan as proposed by by the vuac was approved as the interim plan, and the vuac is directed to continue its study of the same involving all identifiable potential users interests.

the board directed that the fm/rpt column in qst be on a monthly basis.

the general manager was instructed to petition the federal communications commission to permit f2 emission on ten meters for identifying amateur radio repeaters.

the arrl will file with the fcc a petition for rulemaking to permit an applicant who has failed an amateur radio examination test element to retake that test element 27 days thereafter.

the general manager was instructed to prepare a paper on the status of the vienna international center, and the dx advisory committee is to reconsider the 4u1vic question no later than january 20, 1985.

the arrl will request that the fcc issue a public notice advising manufacturers of their obligations with regard to rf shielding and filtering.

a draft petition to permit automatic control of amateur digital communications above 30 was approved in substance.

the vrac was requested to study the band plan for 420 to 450 mhz with the intent of recommending a standard for repeater in out frequency relationships.

there is to be a study to determine what existing and or new dxcc awards if any should apply to the 24 mhz band.

the general manager was directed to determine means by which the advanced class license holder could have a more involved role in the volunteer examiner program. the board unanimously voted to honor mr. e. merle glunt, w3okn, for his contributions to the successful outcome at the 1979 world administrative radio conference for the amateur radio service.

there is to be a survey of u.s. arrl members concerning the feeling about ssb mode operation in the 40 meter band below 7.1 mhz.

the board unanimously resolved to extend special recognition to wa2nnt, wa6qqq, wa6qzy, wa6mrz, kn6h, w6pgm, k6lea, wa6nrb, and n6iiu, for their outstanding service to amateur radio in support of the games of the xiii olympiad, los angeles, 1984.

there is to be a study of the feasibility of arrl offering its assistance to fcc in the area of maintaining amateur licensing records in general but especially in the administration of special call sign requests of clubs and individuals.

the league is to file a petition requesting that the fcc amend the rules governing the amateur satellite service to add the new frequency allocations granted at warc 79.

the board also voted to recognize the district of columbia as a separate multiplier from that of maryland for annual arrl dx contests and the annual arrl ten meter contest.

the full minutes will appear in qst ar

qst de k9eui
hr propagation forecast bulletin nr 44 from arrl headquarters
newington ct october 29, 1984
to all radio amateurs bt

on october 23 the solar flux dropped steadily, to 70 on the 26th, remaining there as this bulletin was written. the high for october was only 77. unless solar activity markedly increases, the october flux average will be just under 74. the most recent month at this level was september 1976, less than 3 months into the present solar cycle.

solar flux records for cycles 18 through 20 show monthly statistics similar to those for october recorded at times averaging only ten months from the ends of the cycles. this is not to say that we have less than a year from the end of cycle 21, but it will have to follow a very different course from its 3 predecessors, if it is to approach the long term average cycle length of 11.2 years.

at bulletin time the flux was coasting at 70, and should rise this week, but probably not above 75. the solar calm has made for good conditions on 14 mhz and lower frequencies but with more muf than given in any long range predictions, such as the charts in recent issues of qst.

no major propagation change is likely before early november. then higher geomagnetic activity will bring lower signal levels and increased fading in high latitude circuits much of the time through about november tenth ar

After receiving many calls from people in various parts of Batavia
and Geneva, IL., concerning TVI to channel 5 (Chicago's NBC outlet)
I started searching with a spectrum analyzer. I saw the interference
at my tv also. The problem turns out to be a 30 watt paging link
transmitter on a tower next to our county sheriff's office. The
paging transmitter is on 75.8 MHz. I have contacted both the tower
owner and the FCC, so we shall see what happens. The system has been
on the air for 6 months and the local hams have been getting the blame
for it all along. We are about 40 miles West of the channel 5 transmitter
and the paging signal is about 10dB stronger than the tv signal at my
house, about 3 miles away.......

Apparently, this spectrum has just recently been authorized for this
type of service. Wonder what we are in for!!!!!! I have beeen told that
these stations first go on the air as a developmental station and they
must determine that they are not causing interference. Looks like these
guys didn't care.....

    Currently the ACL repeater club, of which I am a member, has
started to express intrest in getting a 6 Meter repeater on the air

in addition to our 147.585 IN/146.985 OUT and 222.98 IN/224.58 OUT repeaters. I currently have a ICOM IC-25A and ICOM 2AT, which gives me plenty of 2M coverage, but no 6M or 220 coverage. What I am looking for is equipment and/or plans for a transverter to go from 2M to 6M, and from 2M to 220MHz. This would allow me to use all the features of the ICOM IC-25A (memory, scaning, ect) on two other bands. I have wanted to get on 220MHz and 6M, but I do not want to spend megabucks to do it [I would also like a receiver that covers D.C. to light for under $200 too :-)]. I know there are other hardware freaks like me out there, I think this could be a nice challenge. If I can get plans, I would like to make a dual band transverter with a 2M input jack and outputs for 6M, 2M, and 220MHz. Please send me mail, or if you think this is of general intrest, post it on the net.

This sort of problem is nothing too new, Bob. Private Land Mobile
has used the 72-76 MHz "gap" between TV Channels 4 & 5 for
point-to-point links for a number of years. Check Part 90 of the
FCC Rules for the requirements for the PLMRS not to cause interference
to Channels 4 & 5; they exist, but I can't quote them from memory.
Of course, these same requirements won't apply to paging, which
comes under the Common Carrier rules, but the PLMRS rules will give you a clue
as to what standards exist. I wouldn't be too optimistic about
getting the FCC to do something about the problem, given their
budget-driven low visibility status. What might do some good would
be to complain to Chicago's TV 5 management; they have a vested
interest in seeing their signal "get through" and may be able to
get both the network and the National Association of Broadcasters
to lean on the FCC. Good luck, and post a follow-up with the
(successful) resolution.

Interested in information related to the software/hardware requirements for the reception of RTTY, AMTOR, and MORSE CODE using Kenwood R-2000 and TI-99/A computer.

Preliminary plans include the purchase of TI Terminal Emulator II, CorComp stand alone RS-232 interface, and Kantronics UTU.

Any advice would be appreciated.

Gateway, The ARRL Packet-Radio Newsletter
October 23, 1984
Volume 1, Number 6
Electronic edition.

TELEPORT STA GRANTED

The FCC has granted the joint AMSAT/ARRL request for a special temporary authorization (STA) permitting operation of automatic digital teleport stations. (For complete discussion of this request, and a list of stations involved, see Gateway issues 1 and 5.) The FCC "concluded that the automatic relaying of digital messages between amateur stations on earth and amateur satellites via intermediary stations (stations in teleport operation) may contribute to the advancement of the technical and communication aspects of the art of radio."

The following sections of the Amateur Radio Service rules have been waived for authorized stations:

> "97.126 (a) is waived to permit an amateur station engaged in teleport operations to retransmit automatically the radio signals of other amateur radio stations.
>
> "97.126 (b) is waived to permit a remotely-controlled amateur station engaged in teleport operations to communicate with stations which are not shown on such a station's network diagram.
>
> "97.79 (b) is waived to permit an amateur station engaged in teleport operations to be operated under automatic control without the presence of a control operator at a control point of the station; provided that devices are installed and procedures implemented to ensure compliance with the the

Commission's rules at all times; and, provided further that upon notification by the Commission of improper operation of a teleport station under automatic control, such automatic control shall be discontinued immediately until all deficiencies have been corrected."

Authorized stations may operate satellite uplinks and downlinks on 144-146 MHz and 435-438 MHz. Terrestrial inputs and outputs may be on any amateur frequency at or above 50 MHz where digital communications is permitted.

This STA expires 180 days from October 18, 1984. Good luck to all stations involved.

PACKET RADIO TELECONFERENCE RADIO NET

"Packet Radio Overview and Prospective" will be the subject of the December 2nd North American Teleconference Radio New (TRN). This net, heard on over 150 gateway stations (mostly VHF repeaters) across the U.S. and Canada and on the OSCAR 10 satellite, will explain what packet radio is, describe how to get started in it, point out the benefits to you, and outline the pitfalls to be avoided by the beginner and expert alike. The speakers on this TRN will be none other than Lyle Johnson, WA7GXD, and Harold Price, NK6K.

Lyle is President of the Tucson Amateur Packet Radio Corporation (TAPR) and was one of the primary developers of the TAPR terminal node controller (TNC) hardware. For his work in developing the TAPR TNC, Lyle was awarded the 1984 Technical Excellence Award at Dayton. Looking to the future, Lyle is responsible for the processor design for the upcoming amateur packet satellite (PACSAT). He became active in packet radio in 1981, the pioneer days for this new technology.

Harold is a Director of TAPR and was on the team that designed the software for the TAPR TNC. He is also the AMSAT Project Manager for PACSAT. Harold is another packet-radio pioneer, having first become active in that technology in 1982.

Packet radio offers opportunities for both the traditional communicator and for the experimenter. Learn about packet radio from two of its leading developers by tuning into TRN, Sunday, December 2, 1984, at 6:00 PM CST (0000Z). For a complete list of gateway station locations and frequencies, write the TRN Manager, c/o Midway Amateur Radio Club, P.O. Box 1231, Kearney, NE 68847-1231 (S.A.S.E. please, Canada excepted). Those of you on Compuserve HAMNET can find this list in the XA4 data base.

From Midway Amateur Radio Club

GATEWAYS "DOWN UNDER."

On September 1, from 2000Z to 0000Z, VK2BVD and ZL1AOX maintained a fully "connected" 1200-bit/s data link between Sydney, Australia, and Auckland, New Zealand, on the 20-meter band. Propagation conditions were excellent, and there was little multi-path over the 2650-km, one-hop path. Substantial files were transferred in each direction.

The following day, at the same time, an HF/VHF packet gateway was established using store-and-forward techniques with link-level acknowledgments. A total of 5 terminal node controllers (TNCs) and two computers were linked via 2-meter and 20-meter packet radio. Both ZL1AOX, in Auckland, and ZL3QL, in Cristchurch, were able to access the 2-meter local-area network (LAN) in Sydney.

The gateway was in operation again on September 3, with a VHF beam orientation problem solved. ZL1AOX was able to connect to a host computer at VK2ZRQ and interactively operate the machine for over an hour. Both the HF and the VHF ports of the VK2BVD gateway functioned as expected.

Other stations monitoring these activities included ZL3THJ, VK2AQG, VK2AYD, VK2XY, VK2ZXQ, and VK2KFJ. Via VK2BVD

TRANSLATION OF GATEWAY

As part of its continuing effort to promote digital communication modes, the Radio Club of Chile has been translating Gateway into Spanish. We received a photocopy of the Spanish edition of the premier issue of Gateway, including an excellent translation of Jon Bloom's "Introduction to Packet Radio." If you need the Spanish edition of Gateway, contact

Radio Club De Chile
Departamento De Comunicaciones
Centro De Documentacion
Nataniel Cox 1054 - Santiago De Chile
CHILE

RF DESIGN TEAM

A few Motorola engineers, members of the Florida Amateur Digital Communications Association (FADCA), want to design radios for amateur digital operation around 900 MHz (there will soon be an amateur assignment in this band). This group, chaired by Tom Kneisel, K4GFG, is looking for individuals to help them define the interface between their radio hardware and network controller hardware that is under development elsewhere. These are

competent and interested engineers, just looking for a little more coordination and information. If you can help, contact

Tom Kneisel, K4GFG
1600 S.W. 115th Ave.
Davie, FL 33325.

Via FADCA>BEACON

DEMONSTRATION IDEA

If you want to demonstrate amateur radio to the public, why not try a shopping mall? The South Brevard (Florida) Amateur Radio Club set up a booth in a local shopping mall, and generated considerable interest in amateur radio. Packet radio played a part in this demonstration, with forty-two third-party messages handled via packet. Twelve of the messages were delivered by the SOUTHNET packet-radio network, and the rest were passed along to the All Florida CW Net, part of the National Traffic System.

If you plan a packet demonstration (at a mall or anywhere else) remember to bring along plenty of backup equipment. The South Brevard group ran into strong electrical noise on their primary frequency, but since they had a couple of portable digipeaters in the mall parking lot, they were able to maintain solid connections to their message system. Via FADCA>BEACON

TSRAC PACKETS

In keeping with the feeling that Special Service Clubs (SSCs) should keep up with state-of-the-art technology, several members of the Triple-States Amateur Radio Club (TSRAC) have been experimenting with packet radio. Don Knollinger, WB8ZTV, and Jay, KD8GL, have been communicating via packet, and prompting their fellow club members to join the "digital communications wave of the future." TSRAC serves the area where Ohio, West Virginia, and Pennsylvania meet. Via TSRAC BNT

NEWS FROM ROCHESTER

Fred Cupp, W2DUC, sent us a note giving the details of packet-radio activity in the Rochester, NY area. Fred says that there is now an active Rochester packet group with 7 stations on the air. Thursday night is packet activity night. Look for stations on the standard EASTNET frequency, 145.01 MHz.
Via W2DUC

MT. ASCUTNEY PACKET CLUB

Another new packet club is the Mt. Ascutney Packet Radio Association (MAPRA), which serves the area around Mt. Ascutney, NH. The group's wide-coverage digipeater on 3,000-foot Mt. Ascutney is now a vital part of the growing EASTNET. For more information on MAPRA, contact

Carl Breuning, N1CB
54 Myrtle St.
Newport, NH 03773.

Via NEPRA PACKETEAR

NETWORKING IN CALIFORNIA

Packets from Sunnyvale (near San Francisco) were received in Los Angeles and San Diego this week via several linked UHF repeaters. The path started on 146.58, went through two UHF hops (duplex audio repeaters), then out on 144.76, the alternate LA/SD packet channel. Packets from Oliver Barrett, KB6BA were heard by Harold Price, NK6K and Sumner Hansen, WB6YMH in Los Angeles, and by Mike Brock, WB6HHV in San Diego. More experiments are planned for the near future, including getting some packets up the other direction. From NK6K

UNIX ON EASTNET

Phil Karn, KA9Q, has connected an IBM PC-XT, running UNIX System III, to his packet-radio station. UNIX is a powerful, multiuser, multitasking operating system, and Phil's computer can be accessed simultaneously via telephone, packet radio, and operator console. Programs currently available include a satellite tracking program, mail programs, and a PBBS-style message facility. In the future, Phil hopes to connect the system to a TNC capable of supporting several level-2 connections, allowing simultaneous computer access to more than one packet-radio station. To use the system as a guest, simply type "guest" in response to the "login:" prompt, and type return when asked for a password.

From KA9Q.

MORE INFORMATION ON GRAPES

We have received some more information on the Georgia Radio Amateur Packet Enthusiast Society (GRAPES). The group is currently using a 146.13/.73 full-duplex digital repeater located on Sweat Mountain. The call of the repeater is KD4NC-1. A PBBS is in the works. GRAPES is running a packet net on 145.54 at 8 P.M., Sundays. The club's address is:

GRAPES
PO Box 223
Conyers, GA 30208.

Via GRAPEVINE

CAPRA MEETING

At its November meeting, the Chicago Area Packet Radio Association (CAPRA) will present a video tape on level-3 linking. The video tape was produced by members of the Central Iowa Technical Society (CITS), following the Iowa Section Technical Seminar. Lyle Johnson, president of TAPR, and Jeff Ward, ARRL computer engineer, were the featured speakers at that seminar, and the video tape should be interesting to those looking forward to a true amateur packet-radio network. The CAPRA meeting is at 2:00 PM, November 10, in the Glenside Public Library, Glenside Hts., IL.

Via HAMNET

SOFTWARE AVAILABLE

One of the reasons that packet radio has been able to grow very quickly is that many technically-skilled individuals have been willing to donate the fruits of their labors to the packet-radio community. One of the results of this nonprofit atmosphere is that packet bulletin board software and TNC software is available from several sources. Most of this software is in the public domain, and "sells" for the price of disks or PROMs. Whenever possible, Gateway will print notes on the availability of public-domain software for packet radio.

Lynn Taylor, WB6UUT, has written and debugged a very versatile packet bulletin board system (PBBS) program that runs on Apple II computers. Lynn's software was designed to be as self-maintaining as possible and to squeeze every drop of storage out of two disk drives. It runs under UCSD Pascal, and requires a TAPR TNC, a Thunderware Thunderclock, a CCS 7710 serial port and two disk drives. The software is believed to be robust and bug-free. (As with all free software, however, the user is asked not to complain if bugs are found.) Lynn is willing to give the software to anyone who sends him 3 disks and sufficient postage to return them. Send them to:

Lynn Taylor, WB6UUT
463 Myrtle Street
Laguna Beach, CA, 92651.

If you have a program that you would like to make available to the packet-radio community, send Gateway a description of the program.

PACKET RADIO WITH THE XEROX 820

One of the decisions reached at the recent meeting of the ARRL Ad Hoc Committee on Amateur Radio Digital Communications was that the Xerox 820 computer would be used as a benchmark and a testbed for packet-radio networking software. While it is possible to send and receive packets using the serial I/O (SIO) on the 820, this job can be done more easily if a high-level data-link controller (HDLC) chip is added to the computer. In a recent issue of FADCA>BEACON, Howard Goldstein, N2WX, outlined his design for such a modification to the 820. After the Digital committee meeting, Howard and some members of TAPR went to work producing a kit for this modification. The kit, now called the "FAD board," is nearing completion; several prototype circuit boards will be finished by the time you read this. After Howard tests these first units, the circuit board will be made generally available. The FAD board is a "piggyback" board that replaces the Xerox 820 SIO with an 8530 HDLC chip, giving the user two RS-232-C or TTL HDLC ports. If you are interested in this circuit board, contact TAPR for ordering information.

From G@WB9FLW

ABSTRACTS

"How Good is Your Network Routing Protocol?," by Hsieh and Gitman, Data Communications, May, 1984. This article investigates one of the most important aspects of packet-network design -- packet routing. There are many routing procedures under consideration for amateur packet networks, and it is interesting to read about what the professionals do. The article addresses route generation, link cost, packet ordering, and packet-forwarding operation. Two charts detail the routing strategies used by ARPANET, TYMNET, SNA, DATAPAC, and TELENET, and the effects that the chosen routing strategies have on those networks.

"Implementing X.25 Communications Protocol," by Eric L. Beser, Microsystems, June, October and November, 1984. This series of articles is a tutorial on X.25, the CCITT packet protocol on which the AX.25 amateur standard is based. The first article reviews layered network architecture, and introduces state machines and their use in protocol implementation. The second article discusses the design of Pascal software to implement X.25 with the Intel HDLC chips. The third article will discuss implementation of X.25 using the Western Digital WD2511. If you are interested in designing a TNC, or just finding out how your TNC works, read this series of articles.

"RF Modems," by Hatchett and Howell, R. F. Design, September/October, 1984. This article is the first in a series

of articles covering design and construction of RF modems. Several amateur groups are currently working on such modems, so this is a timely article. From the ground up, this first article addresses the basics of RF modems, system design trade-offs, types of modulation, and FSK transmitters. It then finishes off with a discussion of integrated circuits that are useful in RF modem design. For the experimenter, there is a block diagram and schematic for a 1.5 Kbits/s FSK modem.

HOW IS GATEWAY DOING?

As this issue of Gateway goes to print, there are more than 200 paying subscribers to the newsletter. Although I have no firm figures, I am sure that many other packeteers are receiving Gateway via electronic mail services or amateur packet-radio networks. I would like to thank you for your support, while reminding you that Gateway would like to hear from you about packet activity in your area.

Jeff Ward, K8KA

Packet repeaters are actually fairly easy to build, as they can be much
simpler than full TNCs. Many of the current TNCs can also function
simultaneously as digipeaters, and in many areas the "local digipeater"
is just the personal TNC of a ham who happens to be in a good location
and makes a point to leave his rig on.

If you want to build a "dedicated" digipeater, you can make do with
less $$. All a digipeater has to do is receive HDLC frames, check
the address, set a bit and retransmit. The old VADCG boards, which
without the upgrade kit have too little memory to be truly useful
as TNCs, can perform this job easily; the software has been written by
KE3Z and WB4JFI, and is available from AMRAD.

Many other "ad-hoc" digipeaters have been constructed, but the VADCG
board will probably be the easiest route for most people.

Phil

>

I have a TS-520S which has been a good rig for me, but there is one thing about it that I have always wondered about. The carrier level control is scaled from 0 to 10, but to obtain the correct plate current level, the control is always set to about 1. Since the useful range of this control is so limited, it is very touchy. Is this a characteristic of all TS-520S's, or should I look for some problem with mine? If this is common to all, why design a control like this?

I have been tempted to make a change in the rig, but it has performed perfectly since I got it used a year ago. I would like to be sure there is not some reason the control is like this before I risk messing up a good thing.

Thanks,
Robert Neece N4JEO

[]
About 3 weeks ago I suggested a newsgroup for radio controlled airplanes.
The response has been fairly favorable, with comments that the discussion
should not be limited to just airplanes.

Because no previous discussion relating to RC has taken place on the net,
several people expressed concern that this would just be a "flash-in-the-
pan" newsgroup, with interest dying soon after formation. To test this
idea, we will post our discussions in net.ham-radio for awhile to see just
how much hard-core interest there really is. If discussion continues for
an extended period of time, we will be able to form our own group.

If anyone (especially the regulars in net.ham-radio) objects to this plan,
speak now or forever (till we get our own group) hold your peace.

Anyone with an interest in RC or modeling in general is encouraged to take
part in these discussions. With over 100,000 people involved worldwide in
RC aircraft, I expect good results on our net.

My approx. 80 yr old mom in Belleair Beach Florida is a ham. I am not,
but I have always done her technical work for her. We have a problem:
She has a multi-band trap vertical working against a fine ground plane.
However, because this is lightning country with a vengeance, I have
the vertical grounded with a battery cable clamp biting the vertical.
Mom can't open the clamp anymore (weak hands). Does anyone know of a
good antenna grounding relay suitable for such an application.
Antenna is about 4 ft from salt water bay. Has to withstand salt water
corrosion, fungus, etc. - all the tropical stuff. Prefer 110 vac coil.
THanks in advance.

It's been decided that this group is most appropriate for use
in discussion of radio controlled modeling. (planes, boats, cars,
helicopters, etc)

I think it would be nice if we could get our cast of characters
established initially. Later, we can move on to kit/engine/radio
reviews, flying experiences, club activities, etc. To get the ball
rolling, here's a profile of myself. I've tried to include things
I thought I'd be interested in learning about other people in the hobby.

Name: Scott Wiesner
Home: Boulder, Colorado
Age: 22
Years in RC: A tougher one to answer. During junior high, I was
     a member of the Mid Missouri RC Association. I flew for
     about a year and a half, but when my family moved, I never
     got involved in the local activity. Having just recently
     graduated from college, I thought I'd get back into the
     hobby to fill up my spare time. I spent a month deciding
     what to get, a month building, and soloed at the end of August
     during my 8th flight. I guess it's like riding a bike.
     My instructer never had to take the transmitter away from me.

Current equiptment: At the moment, I'm still flying the plane I
     re-learned on. I've got a Futaba FG7-K FM radio, Great Planes
     Trainer 40, with a K&B .40. I'm working on a Windfree sailplane,
     a New Era 40, and have a Cap 21 in the closet for a winter
     project.

Flying field description: We (the Boulder Aeromodeling Society) have
     2 paved runways, 30x350 (NS) and 30x300(EW). Prevailing winds
     are out of the South.

The problem I see with your particular mix and match is that your
base system is FM. Will you be able to get an FM 2 channel receiver?
Seems to me that most companies only provide FM on their higher end

models. I doubt you'd have trouble as long as you get the receiver tuned to the transmitter.

One thing for you to check on is whether Airtronics makes radios for hobby shops like Futaba does. Hobby Shack now sells FM versions of their radio, which I'm sure is a Futaba in a different box. This would probably be the cheapest route to get a flight pack.

If you do get a 2 channel receiver, open it up and see if it is really a 6 or 7 channel without the extra connectors. I've heard they do this so they only have to have one board line in manufacturing.

**** UoSAT Bulletin-99 (Edited) 2nd November 1984 ****

UoSAT Spacecraft Control Centre,   University of Surrey

** GENERAL NEWS **

* UoSAT-OSCAR-11 QSL *

The first printing of these QSL cards was rejected but relacements are promised for next week! Patience will be rewarded!

* UoSAT-OSCAR-9 Competition *

We should like to remind schools etc. that the Department of Electronic Engineering of the University of Surrey has offered

a prize of 100 pounds, or equivalent, to the student group it considers to have been the most successfully active utilising the telemetry and experiments from the UO-9 spacecraft. The competition was announced in the UoSAT School's Booklet, 'UoSAT - A Guide to its Capabilities, Operation & Usage', published by UoS in 1982 and is open to all student groups from educational establishments world-wide. Submissions for the competition, which is intended to encourage the educational usage of the spacecraft, should be in the form of a detailed report showing clearly the experimental programme development, receiving & display equipment, computer software and the results of the experiments carried out. Particular notice will be taken of examples showing the use of the spacecraft in demonstrating space technolgy in the class-room. Photographs, where appropriate should be included, as well as examples of graphical plots and computer displays of data. The closing date for the competition is 31st December 1984.

* SECOND ANNUAL AMATEUR RADIO SATELLITE SYMPOSIUM *
AND 1984 AMSAT ANNUAL MEMBERSHIP MEETING

G3YJO and G8NOB (Martin & Neville) will be attending the Meeting and it is likely that an additional item on UoSAT will be included in the Programme.

* Meteorological Spacecraft News **

* NOAA-9 *

The launch of NOAA-F (9) is now set for the 8th of November.

** UoSAT-Oscar-9 Schedule **

This weeks schedule is as follows:

Friday	-	load Bulletin
Saturday	-	Bulletin/DIGITALKER/1200 bps telemetry
Sunday	-	Bulletin/DIGITALKER/1200 bps telemetry
Monday	-	Bulletin/DIGITALKER/1200 bps telemetry
Tuesday	-	CCD Camera - next week Radiation data
Wednesday	-	Whole orbit telemetry survey
Thursday	-	Computer check-summed telemetry

The 21 MHz Beacon will be in use this week.

** UoSAT-Oscar-11 Operations **

* Digital Communications Experiment *

NK6K and LSK have spent much time this week preparing for activation of the DCEby carrying out digital communication calibration tests using the 435 MHz beacon in 1200 bps afsk.

The UO-11 DCE will be a major topic of discussion (2days!) following the AMSAT Meeting in LA next week with G3YJO & G8NOB.

* The 435 MHz downlink is functioning well with an output rf power of 750mW to 1 watt, consuming around 225 mA from the +14v unregulated bus. Very strong signals are received from this beacon, 1200 bps afsk telemetry has been copied at UoS without difficulty using an IC471, no preamp and a linear polarised yagi.

* Experiments continue with the 9600 bps nrzi psk data on the 435 MHz downlink in preparation for DCE, CCD & Particle/Wave Experiments.

* Particle/Wave Experiments - UO-11 and the AMPTE spacecraft are in conjunction for two weeks allowing the simultaneous measurement of P/W interactions with UO-11 and UKS. A number of regular P/wave surveys over the North polar regions have been carried out using the OBC and the DSR this week. Most of the data was dumped using the 145 MHz downlink whilst work continues on the 435 MHz psk downlink system. These conjunctions occur only once every six months so we must make the most of it!

A daily account of UO-11 operations follows:

DAY	ORBIT	CHANNELS	RESET TIME
***	*****	********	**********
Friday	3488	1,2,3,52	13:17:25
	3491	435 MHz DCE 1200 bps afsk test	
	3492	435 MHz DCE 1200 bps asfk test

To all my friends in USENET-land
I've moved to a new Bell Communications Research building in Livingston, NJ.
Hence my new net address is lcuxc!wjm. You can reach lcuxc through
ihnp4 or whuxl or via one of the Piscataway UNIX systems.
I'll be submitting articles from there as soon as we get netnews up on the
new system.

Regards,
Bill Mitchell ({ihnp4|whuxl!}lcuxc!wjm

x
       PIRATE BROADCASTER - "ALTERNATIVE RADIO/WMTV"

On November 3rd, I monitored the weak 7435 kHz AM signals of
a pirate broadcast station from about 11:30 PM (CST) through
0130 (CST) the next morning. The male disc jockey played
rock music and identified the station as "Alternative
Radio", using the call letters of WMTV (assigned to a telev-
ision station in Milwaukee).

The disk jockey said he was taking music requests, and gave
two phone numbers: (305)936-1812/1813. I called both. Cal-
ling one produced some strange "telephone company type" tone
burst noises (phone loop?). The other number was connected
to a telephone answering machine, which played a short mes-
sage and allowed one to leave a message.

Listeners were directed to write for more station informa-
tion to John, at:

    P. O. Box 1945
    Del Rae (Ray?) Beach
    Florida

This station was monitored using an ICOM R-71A receiver and
an MFJ 1020 indoor active antenna.

Yes, it is possible to mix systems. A highly proven lowcost rcvr, two
channel expandable to 4 channel is available from Tech RC (formerly
Royal Electronics) in Denver 303-757-4082. You can get it in kit form
and it is available in the various channels. They also have good buys
on servos and servo kits.

Yes I am a ham (W9LXP) and an R/C nut also. In trying to find a notes
net to discuss this sort of thing, it has been pointed out that net.rec
is the likely place, why don't we continue this discussion there?

The easiest way to proceed is to find a local voice repeater which is not

being used very much and convincing the owner to switch it over to a packet repeater. In most cities there are enough (if not too many!) voice repeaters, but rarely any packet repeaters. A plain old repeater can be used for a packet repeater, since the intelligence is in the PADs (packet assemblers/disassemblers) which are located at the terminal/radio equipment. The repeater just gives one the standard advantage of a repeater -- being able to talk farther than on simplex. The repeater itself is oblivious to the fact that it is retransmitting data. In fact, a repeater could double as a voice and packet repeater during different hours of the day, although I wouldn't suggest this as good practice.

> ... [I] have a preference for mode I as what little flying I did
> ten years ago was of that variety. It seems quite a bit more natural to
> me when it came to coordinating turns and the like. ...

I know exactly how you feel. I flew about 10 years ago for a couple of summers, and learned an even more obscure "mode". We called it reverse mode one. Left stick was throttle/aileron, and right stick was rudder/elevator. The argument for the seperation was not too great. Seems the "best" flier in the club (the one who taught everyone else) started out with a powered glider and a four channel radio. Of course the glider was rudder/elevator control, and when he looked at the diagram that explained how the controls were set up, he put his rudder on the left stick. Later when he graduated to a 4 channel powered plane, he realized he'd have to put his turning control, the ailerons on the left stick, and that's how we all ended up with reverse mode one.

I just got restarted in RC a few months ago, and was concerned that old habits would creep in as I was trying to learn mode 2. I only ran into

a problem once. I was flying along, straight and level, and decided to
do a roll. The plane did this VERY strange maneuver, which scared the
!*&% out of me. (I was lower than I should have been to start out with).
I managed to recover, thought about it as I was trying to relax, and finally
realized I'd reverted to old instincts for a moment, and had managed to
do a RUDDER roll. My plane does not do graceful rudder rolls.

Anyway, I still think separating ailerons and elevator makes a lot of sense,
and if I get up the nerve, I'll give it a try. The drawback is that
I'll be "incompatible" with the rest of the world.

(We need to figure out whether net.rec is more appropriate than net.ham-radio
for these discussions until we get our own group.)

    Recently some further information on current Air Force One
communications has been passed to me. It appears that only some
of the previously open circuits have been secured. Specifically :

1. The uhf-nbfm single channel duplex system code
named "nationwide" is still in use from AT&T microwave towers with traffic
in the clear on 415.700 mhz. from AF-1 and 407.850 mhz. from the ground.

2. The vhf-nbfm single channel duplex system code named "Yankee-Zulu" is
still in use from portable ground sites set up at presidential destinations.
It has been reported that it seems to be used for mostly for traffic from the
aircraft and may be in only limited use as a channel to reach presidential
automobiles. Recent reports suggest that this channel is being used for
traffic out to the limits of the ground site coverage rather than just until

the aircraft is in line of sight to a 'nationwide' ground site. Traffic is in the clear on 171.2875 mhz from AF-1 and 162.6875 mhz from the ground.

3. The hf ssb circuits ("Mystic Star") continue to be used occasionally for phone patch traffic to the aircraft, and are still in the clear. However, propagation being what it is these days, transmitting traffic over hf (both clear voice and secure tty) hasn't always been easy.

4. The nbfm full duplex circuit over the Fltsatcom spacecraft continues to be used, with 260.845 and 260.860 used for downlinks to AF-1 and the ground station at Andrews repectively. Data is occasionally exchanged (secure voice or fax ?) but most of the time the circuit carries a holding tone. One report says this circuit is used for occasional clear voice com coordination traffic also.

5. Many of the secret service channels are still used in the clear. I am told that presidential protective traffic in the clear has been observed on secret service channels "Oscar" - 164.8875, "Sierra" - 166.5125, "November" - 167.025, "Tango" 164.650, and the national channel "Charlie"- 165.375. One observer noted keyed carriers on "Mike" 165.2125 that may or may not be some form of digital voice (not however classical DVP with an audible preamble pattern), but as spectrum signature equipment was not available it wasn't possible to certainly identify the nature of this signal. Another observer reported what may be amplitude compandered ssb in use on "Baker" 165.787 (I think this may just be an image from 2 meter ssb).

6. Recent tv coverage of the presidential vehicles in a motorcade showed the same old high band vhf whips as the secret service has always used, which would tend to confirm (5) or at least suggest that no new rf frequencies have been assigned in some other portion of the

<line eater meat>

Recently some further information on current Air Force One communications has been passed to me. It appears that only some of the previously open circuits have been secured. Specifically :

1. The uhf-nbfm single channel duplex system code named "nationwide" is still in use from AT&T microwave towers with traffic in the clear on 415.700 mhz. from AF-1 and 407.850 mhz. from the ground.

2. The vhf-nbfm single channel duplex system code named "Yankee-Zulu" is still in use from portable ground sites set up at presidential destinations. It has been reported that it seems to be used for mostly for traffic from the aircraft and may be in only limited use as a channel to reach presidential automobiles. Recent reports suggest that this channel is being used for traffic out to the limits of the ground site coverage rather than just until the aircraft is in line of sight to a 'nationwide' ground site. Traffic is in the clear on 171.2875 mhz from AF-1 and 162.6875 mhz from the ground.

3. The hf ssb circuits ("Mystic Star") continue to be used occasionally for phone patch traffic to the aircraft, and are still in the clear. However, propagation being what it is these days, transmitting traffic over hf (both clear voice and secure tty) hasn't always been easy.

4. The nbfm full duplex circuit over the Fltsatcom spacecraft continues to be used, with 260.845 and 260.860 used for downlinks to AF-1 and the ground station at Andrews repectively. Data is occasionally exchanged (secure voice or fax ?) but most of the time the circuit carries a holding tone. One report says this circuit is used for occasional clear voice com coordination traffic also.

5. The Autovon uhf-fdm mux signals seem no longer to be used, at least in areas far from ground stations. I have received no reports of traffic on these channels, and would appreciate hearing from anyone who can verify that these links are no longer used. I would especially appreciate hearing from someone who knows (and can say) what has replaced these links.

6. Many of the secret service channels are still used in the clear. I am told that presidential protective traffic in the clear has been observed on secret service channels "Oscar" - 164.8875, "Sierra" - 166.5125, "November" - 167.025, "Tango" 164.650, and the national channel "Charlie"-165.375. One observer noted keyed carriers on "Mike" 165.2125 that may or may not be some form of digital voice (not however classical DVP with an audible preamble pattern), but as spectrum signature equipment was not

available it wasn't possible to certainly identify the nature of this signal. Another observer reported what may be amplitude compandered ssb in use on "Baker" 165.787 (I think this may just be an image from 2 meter ssb).

7. Recent tv coverage of the presidential vehicles in a motorcade showed the same old high band vhf whips that the secret service has always used, which would tend to confirm (6) or at least suggest that no new rf frequencies have been assigned in some other portion of the spectrum.

qst de k9eui
hr propagation forecast bulletin nr 45 from arrl headquarters
newington ct november 5, 1984
to all radio amateurs bt

during the last 5 days of october, the solar flux varied between 69 and 73 , a range characteristic of months close to the end of the 3 previous cycles for which flux records are available. despite the low solar flux, the period was marked by generally good propagation on 14 mhz and lower frequencies. 21 mhz was open over much of the world at times, but only for short periods. 28 mhz was active mainly on north south and low

latitude circuits.

the solar flux rose after october 29, but geomagnetic indices also rose, and propagation in the higher latitudes suffered markedly. conditions are expected to continue erratic through november tenth, becoming more stable november 11 to 15th. slightly higher flux readings should increase activity on 21 and 28 mhz at this time. degraded conditions are likely november 15 through 20. for several days after about november 21, we may have some of the best propagation of the autumn dx season. more on this possibility will be given in later bulletins.

american sunspot numbers for october 25 through november 2 were between 0 and 9 with a mean of 3.6 ar

hr crrl bulletin nr 35/36 from crrl headquarters
london, ont november 5, 1984
to all radio amateurs bt

the ares canada net meets on 14,115 khz at 2000z on sundays.
everyone involved with or interested in emergency
communications is invited to check in.

crrl is conducting a survey on three important issues,
expansion of the canadian 75 metre phone band, deregulation of
mode subbands and the concept of some form of communicators
license.

thanks to the efforts of the radio society of ontario, call
letter licence plates for ontario amateurs will soon be
reduced.

crrl members in the atlantic, ontario and prairies regions are
reminded that the deadline for returning ballots in the crrl
director elections is november 20 ar

Hello out there:
I would like to see a group on RC stuff. I want to do things related to aids for the handicacped.
Since I am blind planes would be a real smash.

qst de k9eui
hr dx bulletin nr 40   from arrl headquarters   newington ct
november 2 1984   to all radio amateurs   bt

mellish reef. the down under dxers club dxpedition headed by vk2wu apparently left mellish reef last monday, five days ahead of schedule. vk9mr was worked thhroughout north america on 15, 20 and 40 meters during the contest last weekend, and by a lucky few on 80 and 160 meters. qsl to vk2wu.

160 meters. several rare stations showed up last weekend and are still active this week on top band. watch for d44bc, 5w1ej, wb0miv/8r1 and kj9w/kh2. also, the excellent transequatorial conditions experienced for the last six weeks are beginning to deteriorate.

china. by4aa has been trying 80 meter ssb on a regular basis. look for operators john and chou on 3795 khz, especially on thursdays in the company of du9rg.

propagation. 160 and 80 meters have been very quiet lately,

and many weak signals are copyable. 40 and 20 meters still appear to be suffering from recent solar storms, as many signals have unusual flutter. good long path openings have been experienced at both sunrise and sunset on 40 meters, with many zone 17 and 18 stations worked by east coast u.s. stations on the long path around 11 to 1200z. the solar flux continues to decrease as we head toward the bottom of cycle 21.

sao tome. our latest rumor says that ps7abt/s9 was in sao tome but was asked to qrt by local authorities. no official word.

papua new guinea. jim, p29js, continues active three or four days per week on 40 meters from 11 to 1300z. after conditions fade, jim tries 80 or 160 meters. jim plans to be active for one more year.

philippines. karl, k4yt, was last heard as k4yt/du9 during the cq ww contest. qsl to ke3a.

taiwan. another expedition to taiwan is planned for late november, this time by a group from washington, dc. organized by barry goldwater, k7uga. the group hopes for an 80 meter ((garble)). operation will probably be as bv0bg and will include the cq ww cw contest.

south sandwich. several rumors have been heard about operation this month or next from south sandwich in the atlantic ocean. watch for either 4k1i or vp8asr or g4ghp/vp8. no confirmation has been received about any of these operations. more information will be available in future bulletins as we receive it.

salvador. members of the radio club ysdx will operate hu1dx and hu11fi from november 2 through 11 in conjunction with the xi international fair being held in san salvador. ar

Ok, I goofed. There were some initial comments that net.ham-radio
was a good place to carry on the RC discussion until we can show
a need for our own group. I posted a note saying net.ham-radio was
the place to be, but the slow network propogation caught me by
suprise. A few comments had been posted in net.aviation saying
net.rec was probably most appropriate. I agree with this completely,
so if you're interested in Radio Controlled anything, we'll now
be in net.rec.

This will be our final resting place until we get our own group or
die from lack of interest. I'm sure we'll have notes in the ham
group, and perhaps net.aviation for the next week or so until everyone
gets the word. Be patient. We're trying to do it right.

I have recently obtained an IBM-XT and sold my TRS-80. I would like to
know what RTTY setups are availble for the XT.
I was using the Crown Micro-products system on the TRS-80 and a Flesher
TU-170. Both are availble. The Crown has the standard RTTY and CW programs,
alsothe MAILBOX Version.

Any info would help.
Thanks in advance,

   Hi fellow r/c nuts, I'm fairly new at the hobby (< 3 mo.). Here is the
equipment I started with:

     R/C gear : Airtronics XL6 FM  transmitter and receiver
              : Airtronics standard servos

     Planes   : Airtronics Olympic 650
                 : Bob Martin - Katie II  (almost done)
              : ?? Silent Squire (just begun)

   So far I've only flown the 650 but am enthusiastic about getting the others
in the air. I would be interested to hear about others planes, first flying
experiences, etc.

   I and a friend are looking into a couple of areas related to equipment.
```

One is a good charger for the nicad packs. (found a pretty good one in
OCT '81 QST) Also we are considering the possibility of constructing
receiver modules. (Receivers seem to be very expensive items and I don't
particularly like to keep moving the one I have from plane to plane)
Another posibility is constructing transmitters and receivers that operate
in some obscure section of the ham VHF bands (legal if under 1 Watt).
I welcome all comments, information or any correspondence.

TNX, 73 Rob Paull (KA6SFV) (AMA-144145)

Is anyone doing anything with amtor and their IBM pc? If so, please
send me mail, as i am interested in doing same.

I have two public domain RTTY software packages for the IBM pc.
Both are in basic, and i got them off of a bulletin board. If you
are interested, i have them on unix, or can provide disk copies
(your disk)

Cushcraft has a 1/2 wave multiband vertical called the R3.
Anyone have any experience with it? It seems awfully expensive
for what it is.

Summary: IC-25A installation in 1982 Toyota Celica

In article <3103@ucbvax.ARPA> medin@ucbvax.ARPA (Milo Medin) writes:
>

>
>
>   Milo

I installed a 2m rig in my 1982 Toyota Celica; I'm not sure how similar

the interiors of the cars are, but this may give you a few ideas.

First the antenna: I have a Larson NMO antenna mount that I installed in the center of the roof of the Celica. If it's a new car you may not like the idea, but the alternatives that I tried didn't work out for me. I tried to use a through-the-glass antenna on the hatch, but that didn't work worth a damn for me. The Larson mag-mount that I used for a while worked, but I always had to take it off the car whenever I parked it. With the NMO mount on the car, I usually use a quarter wave whip (unobtrusive) normally, and screw on a 5/8 wave for trips and such. It works great for me. To install the antenna on the roof, remove the dome light from the inside of the car to get a look at the space between the headliner and the steel roof. For the NMO, a 3/4" hole is required; the best way to do this is to drill a 3/8" pilot hole, and use a hole punch. Makes for a real clean hole. Remove the trim along the edge of the headliner near the door, and fish the coax cable out and along the door edge and down the column near the windshield. I was able to install my antenna in about an hour.

The rig: This is the hard part.   I've got an ICOM IC-25A, which is a pretty small radio. I'm sure you've noticed that there are no really good places to install it inside the Celica that will look good. A simple place to install it is on the side of the transmission hump, but that looks asymmetric and beside, you can't slide the seat up all the way anymore. I finally decided to hang it under the dash, just to the left of the steering wheel column. I was able to use two existing screws in the dash assembly, so I didn't have to drill any holes in the dash, just get longer screws. It was necessary to redrill holes in the mounting bracket of the radio. It is difficult to explain exactly how to install it, but is is tucked as far to the right (towards the steering column) as possible. It doesn't interfere with my feet or legs while driving, but you must be a just a little carefull when entering or exiting the car.   The ICOM bracket is a quick relase type, so the radio can be removed if you're worried about it walking off. Power comes from the fuse panel just below the radio. Simple. (Well, fairly simple, anyway). Radio installation took about 2 hours, mostly measuring and drilling the bracket for the radio.

Regarding the suggestion to use voice repeaters for packet, I have some
comments.

1. Voice repeaters are usually not designed for fast, bursty transmissions
such as those produced by packet boards. Keyup delays can involve quite
a bit of overhead, particularly if mechanical relays are involved. The
constant "kerchunking" involved in packet can cause quite a bit of wear
and tear on these relay-switched machines (and on their tech-committee
chairmen.)

2. Voice and packet users simply cannot coexist peaceably on the same
repeater. The "racket radio" users drive the human listeners to distraction
(mainly because they can't understand what's being said about them!), and
the long-winded voice users can bring data traffic to a standstill.

3. Because of carrier hang timers on most voice repeaters, the TNCs cannot
use RF carrier detect for CSMA (not that many people do, even on simplex),
but must use modem subcarrier detect. This also has the effect of infuriating
the voice users, since they get stepped on by the packet boxes.

4. A voice repeater is very expensive in comparison to a single
frequency "digipeater", since it requires cavities and isolation to
run in full duplex.

5. The one advantage of using a voice repeater over a single frequency digipeater is that collisions due to one station's inability to hear all others on the channel can be avoided. However, working against this is the fact that a wide-coverage repeater forgoes the possibility of "frequency reuse", in which two pairs of stations who are far enough apart could communicate simultaneously on the same frequency without interference, given enough of a signal-to-interference ratio to get good capture.

There is an opportunity for a research project here that would be of real use to amateur packet radio. Do an analysis to find, given an actual set of user stations and antenna QTHs, the optimal power level for each station to make maximum utilization of a channel, considering the effects of digipeating, collisions, etc, and to compare the results to the efficiency of a wide-area duplex analog repeater. One might start by looking at the work of Kleinrock and others and seeing how it might be applied to a practical situation. I remember one paper of his in which he showed that a packet radio network did not have to be "disconnected" (i.e., have pairs of stations that could not directly communicate) to a very great degree before the channel throughput degenerated to the Aloha level. It would be interesting to see how this bears out in an actual situation.

In any event, my practical advice is to put up a single-channel digipeater in a good location if you want to provide a utility service to the local packet radio community.

73, Phil, KA9Q

On 14MHz, my Ten-Tec Omni transceiver suffers from breakthrough from strong European broadcast stations in the 49M band. The spurious response is due to harmonic mixing: 3 * LO - IF, where LO = 5+MHz and IF = 9MHz. It is at a level of -75dB relative to the wanted signal.

On a 100ft G5RV-type multiband dipole fed via a bandpass tuner and 600 ohm

line, the unwanted broadcast stations are about 10dB above the receiver noise floor. The Omni only has a 2 pole preselector, so I guess this performance is reasonable. I could fix the problem by using an external high pass filter but this makes band changing inconvenient.

Since the Omni looks as though it's been designed by direct application of the Hayward & DeMaw book "Solid State Design for the Radio Amateur", I wrote to Ten-Tec asking whether replacing the 1N4148 diodes in the ring mixer with hot carrier types would reduce the spurious resonse. They replied that in their experience there is no improvement. This conflicts with Hayward & DeMaw's findings.

Do any of you electronics gurus out there have any comments, before I start hacking at my Omni and destroying its resale value?

There seem to be several articles here referring to things I haven't seen on Usenet. Is the arpa ham radio list leaking into this group?
I haven't seen anything that would have started the replies referring to ham vs. swl. Can we get the arpa list in its entirety here?

The Icom xmit to rcv delay only happens when the Touch Tone[tm] pad is used.
The idea is that when dialing, you don't have to hold the PTT buttin in
after you have pressed the first number. Thus, the remaining digits can be
entered easier. I suppose this feature could be defeated.

senator barry goldwater, k7uga, introduced legislation into congress on september 11, 1984, that will make it a federal offense to willfully and malciously interfere with radio communicaions. the bill prohibits jamming by any person and authorizes the fcc to prevent continued interference while proceeding against the perprerator. senate bill 2975 also clarifies and reaffirms existing law.

goldwater, in addressing the senate, said "recently the federal communications commission has noted a significant increase in the number of complaints concerning willful or malicious interference to radio signals. i have personally listened to some of this malicious interference. just one individual can prevent effective communications by many other persons wishing to use a channel.

"there is only a limited amount of radio spectrum available, so we must ensure it is wisely used in the public interest. unfortunately this errant behavior is increasingly preventing such use in a number of different services." goldwater said such objectional interference is created by intentionally transmitting on a channel already in use or by "whistles, tapes, records or other types of obnoxious noises... transmitted for the sole purpose of interrupting or preventing other uses of the frequency."

while noting that this type of interference is prevalent on the amateur, citizens, and marine band, goldwater said that it is also creeping into the private land mobile, public safety... (and even the) government communications networks such as those of the faa and department of defense.

"the increase in willful interference to authorized communications simply must be stopped in order to ensure the reliability of the authorized public interest and safety uses of the radio spectrum."

"the purposes of this bill are to clarify that such activities are absolutely prohibited, to provide mechanisms by which such interference can be stopped in a timely fashion and to authorize significant penalities for such behavior. if this proves insufficient, i am prepared to introduce even tougher legislation to further increase the penalties for violation and include, for example, mandatory disqualification of those convicted from being licensees in the future." goldwater said he hoped that this would not be necessary.

at this point, goldwater referred to several amateur radio cases of willful and malicious interference including:

- transmission of unmodulated carriers, recorded material music and threats, made directly over the ongoing transmissions of other operators (harold r. claypoole, n6bii, 1983)

- long, continuous transmission of computer voice synthesized audio signal or ticking clock on repeater input frequency (henry c. armsrong, wa6cgi, 1983).

- initiation of transmissions when others were already using the frequency, including changes in frequency which coincided with changes made by parties attempting to evade the interference (kenneth l. gilbert, kb6tg, 1982)

- whistling on frequency for a long period of time for jamming purposes (donald e. miller, callsign unknown, 1978)

these cases illustrate examples of the type of purposeful

interference which this bill prohibits." goldwater said that he didn't intend to limit the definition of the bill's terms to these activities "but rather to explain the type of behavior to which the bill is addressed."

interference to home electronic entertainment equipment was not addressed in the bill. goldwater said he recognized that some interference is suffered by stereo amplifiers, television sets and telephones when they are operating near an operaing radio transmitter. he cautioned that he did not want s.2975's provisions to be construed as applying to interference caused by susceptibility of equipment to rf energy. "more often than not the problem is caused by the improper design of equipment experiencing he interference," goldwater said.

s.2975 will elevate willful and malicious interference to a criminal offense pursuant to section 501 of the communications act. this section provides for both a fine of up to $10,000 and imprisonment of up to 1 year for a first offense and the same fine and up to 2 years imprisonment for repeated offenses.

"73 magazine" to continue publication

contrary to what you may have heard, "73 magazine" is alive and well and its financial future is secure. it is a well known fact, however, that amateur radio is not the direction that cw communications (73's new parent) is moving toward. when wayne green, w2nsd/1, sold out his publishing empire for 60 megabucks, it included "73 magazine" one of the pioneer amateur

radio publications.

cw communications did indeed try to unload "73 magazine" it even offered it back to wayne green but wayne has so many irons in the fire now with his wayne green enterprises, that he said he just didn't have time to get further involved. he still writes his famous "never say die" monthly editorial. right now wayne is on his way to asia to a computer show in japan with a side trip to the caroline islands.

cw communications has now made a strong commitment to 73 magazine and we are told that we can look forward to some exciting things from them. the publication received a very positive letter from debra weatherbee a cw communications/peterborough vice president...

next year will be 73 magazine's 25th anniversary and i understand that there will be "some surprises." editor perry donham, kk2y, would not say exactly what. "i'm pledged to secrecy," he said. 73's publisher , jack burnet, is a non-ham, although he has a solid background in publishing. perry is the same age as the publication.

two of peterough's magazines are ceasing pudlication, however. these are "pc jr world" and "microcomputing". cw communications published 52 computer publications in 19 major countries and is, by far, the world's largest publisher of computer related information. only "73 magazine" remains ouside the computer field.

hr dx bulletin nr 36 from arrl headquarters
newington ct october 5, 1984
to all radio amateurs bt

san felix. ce0aa is still active on 80 through 15 meters, both ssb and cw. watch for operators fernando and max on 21030 khz at 1600z, 14236 khz at 2300z, 7085 khz at 0800z and 3795 khz at 0530 and 0930z. qsls should go only to box 700, santiago, chile.

chad. tt8cw, henri, formerly fb8zq, is now reported to be signing tt8cw. he was first reported at 2300z on 14010 khz on wednesday. henri also promises 10, 15 and 40 meter cw. watch for him on 40 meters between 0430 and 0500z.

guinea bissau. j5wwd has been heard lately between 14230 and 14240 khz around 0200z. qsl to home callsign ub5wad.

macquarie island. graeme, vk0gc, is reported to be back on macquarie and plans all band activity for the next year. qsl as before.

zone 23. a new station, ua0yo, has been heard and worked on the east coast of north america, long path, at 1130z on 7006 khz.

contest expeditions. a large number of expeditions are being planned for the cq ww phone contest to be held october 27 and 28. listen to subsequent dx bulletins for further updates.

cambodia. sxu1ss is still appearing every sunday at 1200z on 14245 khz. signals have been getting stronger each week and have been well over s9 throughout most of north america. qsl to ja1hqg.

ecuador. a special event station from quito, hc1a, is scheduled to operate during the 24 hour period october 13 only. operations are scheduled full time on 160 through 10 meters, both phone and cw.

propagation. with winter nearing in the northern hemisphere, static levels have dropped and activity has resumed on 80 and 160 meters. this season is the best time for working transequatorial dx, such as australia and south africa, from north america on the low bands. also watch for long path openings on 40 meters at both local sunrise and sunset.

160 meters. stations heard within the last two weeks on 160 meters include kj9w/kh2, hb0nl and 9j2tj ar

qst de k9eui
hr propagation forecast bulletin nr 41 from arrl headquarters
newington ct october 8, 1984
to all radio amateurs bt

solar flux and sunspot numbers were well below predicted levels since early may, and the sun has been all but devoid of spots for the past four weeks. this has changed all aspects of the dx picture, at a time of year that normally brings some of our best propagation. it is possible that a shift to higher solar activity will develop before winter, but there is no credible evidence on which to base a prediction at this time.

there were brief spurts of dx on 28 mhz in recent days, and 21 mhz has been fairly lively for short periods, but both bands are far below what had been expected for the northern u.s. and adjacent areas of canada.

during the forecast week, propagation is expected to improve gradually up to the middle of october. fairly severe disturbances will return about october 17 through 25. the month will close with generally better propagation on all frequencies, but with 28 and 21 mhz not performing up to earlier expectations for this autumn. for more than a month the sun has looked very much like it did at the beginning of the current solar cycle in the summer of 1976. dx on the higher bands has suffered markedly as a result.

american sunspot numbers for september 27 through october 3 were between 0 and 7, with a mean of 1.3 ar

[]

Here are the latest set of orbital elements from Goddard Space Flight
Center for STS-41G.  The epoch rev is an estimate, but should not make
any difference in the orbital calculations.

There has been some discussion (in places like Review of International Broadcasting's Radio Equipment Forum or other SWL club newsletters) of the advantages of an non-ham SWL owning a ham transceiver which has a general-coverage receiver section and using this as an SWL receiver. Some advantages claimed are things like having the transmitter available in a future survivalist scenario, gaining the advantage of the advanced technology that goes into the transceivers before it is implemented in receiver-only hardware, easy migration if you get a ham ticket, etc.

This sounds nice, but I always wondered about a couple things:

Are ham transceivers made in such a manner that the transmitter section can be totally switched off and the unit used for receive-only operation? I wonder about the transmitter being accidentally triggered when a non-resonant antenna is connected, thereby damaging the transmitter circuitry. Another danger is having receive-only equipment (preamps, active antennas, tuners, whatever) connected to the antenna circuit, and then suddenly sending many watts of RF out through them, frying them crisply. Another concern is power supply wiring. A transmitter is a heavy-load device, usually requiring its own special power circuit direct from the fuse or breaker panel (except for QRP models, of course); but a receiver usually gets plugged into the ordinary house wiring in your bedroom or whereever. If the transmitter section cannot be completely shut down, would not you have to provide the special power wiring for this box, even if you used it for receive only?

Having never fiddled with a transceiver, I am in the dark about this. Comments and explanations are welcomed.

Will Martin

I have an R71A with the 250 Hz filter and find that it performs very
well. Between that filter, the passband tuning, and the notch, I
can isolate even the most crowded of CW signals. Now, if only I
were more proficient in CW! :-) It even does an acceptable job of
picking those 85-hz shift RTTY stations out of the multiplexed
transmissions.

I recently saw this little excerpt from one of the GATEWAY newsletters
posted to this newsgroup. Is there anyone on from the ISI Amateur Radio
Group? I'd like to get more information on this hardware:

> We received the following letter from Richard Bisbey II, NG6Q:
>
> "The Information Sciences Institute Amateur Radio Group (WB6MXZ) has
> been on the air with a 56 Kb packet radio system since December, 1983.
> The equipment consists of 8088-based controllers using the Zilog 8530
> SCC chip and frequency agile 10-watt FSK transmitters and receivers.
> The controller supports serial, parallel, and Ethernet connected
> devices. Assembled controllers cost approximately $650. The system
> uses standard INTERNET (IP/TCP) protocol, and in addition to
> supporting simple link level connections, supports internetworking as
> well as numerous high-level protocols such as TELNET, File Transfer
> (FTP), Mail (SMTP), Multi-Media Mail (MMM,MPM), Graphics (GP), Packet

> Voice (NVP), and Remote Virtual Disk (RVD). The hardware and software can support data rates as high as 1 Mb, well in excess of the current amateur limit of 56 Kb.
>
> "Previous packet radio accomplishments by ISI amateurs include a March 1982 demonstration of transcontinental packet radio internetworking between an aircraft flying above Los Angeles and a fixed station in Virginia, and a November, 1982, demonstration of intercontinental internetwork packet radio communications between Los Angeles, California and The Hague, Netherlands using Intelsat-4A. The ISI group is currently developing a low-cost spread-spectrum system with capabilities similar to the current non-spread system."

This sure sounds like some serious packet radio work to me...

Louis A. Mamakos WA3YMH

     It sounds like 73 would be the perfect vehicle for a publication whose
focus would be: Amatuer Packet Radio. How about all subscribers (and anyone
who can get 73's address through the net here) mail a postcard to 73 requesting
they utilize the talents of their parent organization in the computer area
to apply to rapid developments in Packet Radio.

I'd like to get a ticket again but the exam procedure has changed
since I last visited Varick, St.   Specifically-

1) How/where does one make arrangements to take the exam from a HAM as opposed
   to waiting for a quaterly FCC exam.

2) Also, is 2 years of experience at General or Advanced still required
   for the Extra? Could that experience have occured long ago??

                                                Tnx,
                                                    Jim ihnp4!hou2g!stekas

P.S.- I vote to keep SWL discussions here.   The community of radio
       enthusiasts is small enough already without fragmenting it.
       Should we also have net.ham-radio.[vhf,dx,cw,80am, ...] ?

The base posting of these different shuttle audio relay frequencies did not
arrive here until 10 or 11 October; I've been trying (and failing, of course!)
to hear the ham-radio-club-relayed shuttle
audio on the frequencies I had listed from the last several flights. As I
recall, these frequencies stayed the same over a number of flights; why were
they changed for this one? There didn't seem to be any more interference
than usual on the old frequencies, and, since it is one frequency per band
anyway, there can't be any propagational reasons for moving within
the band. Anybody have any information about this? Can we get the current
set of frequencies announced a week or so PRIOR to the scheduled lift-off?

Seeing them around the end of the mission isn't much use, after all...
```

Does anyone know where and how I can get a battery for my Wilson
Mark IV 2m HT? The model # is BP-4, 11 Volts, 500 maH.
I've tried Wilson Co in Las Vegas but they don't answer my
mail.
Thanks in advance.

A major problem for an SWL who owns a ham transceiver, at least in Canada,
is that it is illegal to own an unlicensed transmitter, whether you ever
transmit with it or not is irrelevant. I assume this is also true in the U.S.
(This has never stopped CB'ers though).

   Hi, I was wondering if any of the hams on the net were into radio
control models? I recently built a r/c sailplane using one of the
no license channels ~72Mhz.
   I am curious if anyone uses the 6 meter (53.X Mhz) r/c frequencies
and if any interference problems were encountered?

   Also, does anyone have further info on the ARRL 6M band plan for
moving r/c freqs. from 53.X to 50.X Mhz?

                     TNX   73   Rob Paull   (KA6SFV)

Does anyone have interest in either a new newsgroup, or possibly
just a mailing list (if there is little response) for the discussion
of radio controlled planes? (and boats, cars, etc) Kit reviews,
flying experiences, and club activities would be possible topics
of conversation.

I would never expect this to be as popular as net.micro or net.singles,
but if we have enough rc people on the net, it would be worth a try.
Sugggested name is: net.rec.rc

Could you please send out the following on Net.Ham-Radio

Help Wanted !!

I'm trying to locate a used ICOM R 70

Can any of you out there suggest a likely source. Or , even better,
do you have one that you'd like to sell. Contact me by mail, or
US Snail to Ian Walton, 430 Hampstead Way, Santa Cruz, CA 95062.

Thanks a lot !

CQ DX CQ DX CQ DX DE G6OKF G6OKF G6OKF

Does anyone know how to modify a Yeasu FT-290 (bought in the U.K.) so that it will cover the frequency range 144 - 148 MHz, instead of the normal 144 - 146 MHz.

Also, does anyone know the rules and regulations that cover Packet Radio, both in England and the United States because the English licence makes no reference to it.

73s from the Amateur at Leeds University

**** UoSAT Bulletin-96   12th October 1984 ****
(Edited Version)

UoSAT Spacecraft Control Centre,   University of Surrey

** Improved UoSAT Answerphone Service **

At long last, we have an operational second telephone line and two answering machines that work - or at least are reputed to! The original telephone number (0483-61202) will carry UO-11 bulletins and data whilst the new number (0483-61707) will carry information on UO-9. Each bulletin will announce which spacecraft it is covering and give the number for the alternate line. We shall commence this expanded service on Monday Oct.15 - please bear with any teething troubles (we have come to expect them now!). We hope that the improved service will be able to provide a greater amount and more useful information than was previously possible with the limited tape time.

** GENERAL NEWS **

** Oscar-10 PSK Telemetry Decoder **

A new Oscar-10 PSK demodulator by G3RUH is featured in the October and November 1984 issues of the British electronics magazine 'Wireless World'. This design is the most robust to date, and has no tuned circuits. Data outputs are RS232 style serial and 8-bit parallel, pin compatible with the popular BBC microcomputer (Acorn). A printed circuit board has been produced and is available direct from G3RUH or via AMSAT-UK. Other support includes a full colour display program for the BBC (Acorn), alignment test tape, Oscar-10 handbook including telemetry definition and decoding equations. See 'Wireless World' to obtain full details. Non-UK residents unable to see this magazine can write, enclosing return postage (essential) to G3RUH (QTHR) or to: AMSAT-UK, LONDON, E12 5EQ, ENGLAND

** METEOROLOGICAL SPACECRAFT NEWS **

* A good publication for those with an interest in 'weather satellites' has become established over the last year - 'The Journal of the Environmental Satellite Amateur Users Group' published by R.J.Alvarez, WD4MRJ, details available from:

2512, Arch Street,
Tampa, Florida 33607, USA

The journal appears quarterly, last issue 22 pages and includes station construction details, WX satellite status reports, meteorological studies, data receiving tips, Soviet wx satellite report & UoSAT status reports.

* NOAA-9

The launch of NOAA-F (9) has been set for the 12th of November. The nominal orbit parameters will give it a northbound equator crossing time of 1430z with an 870 km orbit at an inclination of 98.86 degrees and period of 102.12 mins.

* NOAA-7

This spacecraft appears to have a serious power regulation problem caused by the loss of power supply shunt loads. All systems, however, appear to be operating normally with APT signals on 137.62 MHz and HRPT on 1707 MHz.

* GOES-EAST

The imaging capability of GOES-EAST(5) failed on 29 July 1984 attributed to the burning out of the redundant encoder lamp following the failure of the primary lamp only one week earlier.

* METEOR 2-11

A new Meteor 2 class spacecraft was launched from Plesetsk on 5 July 1984 into a 974 X 954 km, period of 104.1464505 min, inclination of 82.5 deg and is transmitting on 137.5, 137.85 and 137.3 MHz.

** UoSAT-Oscar-9 Schedule **

The 2.4 GHz Beacon will be in use this week.

** UoSAT-Oscar-11 Operations **

* The telemetry real-time frame clock has gained about 4 seconds since it was reset on 28 Sept, it is now running at gmt + 9 seconds.

* The spacecraft Z-spin rate continues to increase slowly of its own accord, due to cross-coupling of the libration energy into rotational energy, and de-spin manoeuvres have continued this week to keep the Z-spin rate slower than about 2 minutes per revolution. The occasional de-spin manoeuvres will continue, but repeated whole-orbit surveys indicate that the GG-lock remains very stable.

A daily account of UO-11 operations follows:

DAY	ORBIT	CHANNELS	RESET TIME
***	*****	********	**********
Saturday	3194	1,2,3,52	10:19:37
(OBC told to change d/link from ODATA to TLM after 19hrs)

Gateway: The ARRL Packet-Radio Newsletter
Volume 1, Number 5
Oct. 10, 1984
Electronic Edition

IOWA SECTION TECHNICAL SEMINAR

There was not enough room in Gateway #4 for a report on my trip to Iowa, September 21 and 22, for the Central Iowa Technical Society's Iowa Section Technical Seminar. The seminar covered many technical topics, but concentrated on packet radio.

Lyle Johnson, WA7GXD, president of Tucson Amateur Packet Radio (TAPR), gave a well-received presentation on packet-radio linking and the outcome of the ARRL Digital Committee meeting. One of Lyle's points bears repitition: We have begun to experience an unfortunate problem in packet radio. People who would otherwise be experimenting with protocols, or modems, or TNCs are not, because they have heard that "TAPR is going to do it." Lyle is worried that the success of the TAPR TNC project is keeping others from experimenting in packet radio. It must be stressed that packet radio needs experimentation. The question of what networking protocol is best for amateur packet radio is not going to be answered by the Digital Committee, TAPR or any other single organization. The question is going to be answered by experimentation. If you want to experiment, do it. Who knows? It might be your software or hardware that answers a critical packet-networking question.

While I was in Iowa, I got to look at the CITS club station that

is taking part in packet meteor-scatter experiments. It is interesting to note that there was no expensive equipment used in the station. A crew from CITS salvaged an old, surplus Motorola VHF rig, built and erected a six-meter beam, and interfaced it all to a TAPR TNC. The only parts that had to be purchased for the project were six-meter crystals. That is ham radio.

VHF AND UHF EXPERIMENTATION

Giving a talk at the Mid-Atlantic States VHF Conference, I was reminded that packet radio, while it makes heavy use of digital technology, has a lot to offer amateurs who are not interested in computers. If you are a VHF or UHF experimenter, you will find that packet radio is fertile ground for VHF and UHF applications. In many parts of the country, the two-meter band is full, and the 220-MHz band is not far behind. This crowding, and transmission speed restrictions on the lower VHF bands, will force packet radio into the UHF and microwave spectrum. So, if you are interested in VHF and UHF design, maybe your local packet group can give you some project ideas.

EASTNET KEEPS GROWING

The east-coast packet radio link has taken one more step toward reality. The MD/DC/VA to Philadelphia link is improving by the day. Joe Fisher, KC2TN, should get a new antenna up this weekend which will make the path as solid as a rock. We have been linking the packet bulletin board systems (PBBSs) at W3IWI and WB2MNF almost nightly. Until we get Level 3 protocols up and running, it looks like linked PBBSs will provide a store-and-forward capability not unlike what we will have with PACSAT. Both Tom Clark, W3IWI and Jon Pearce, WB2MNF, are running PBBSs with Xerox 820 computers and W0RLI PBBS software. From W3IWI

NETWORKING IN THE MIDWEST

In late September, Chicago, IL, and St. Louis, MO were connected by VHF packet radio. The path is in excess of 300 miles, and there are no mountain tops to take advantage of. Congratulations to the more than half-dozen stations involved in the digipeating. Via WB9FLW

UO-11 DATA COMMUNICATIONS EXPERIMENT

During the week of October 1, the UoSat command station in Surrey, England conducted tests and experiments on the data communications experiment (DCE) aboard UO-11. Tests of the VHF uplink and UHF downlink for the DCE culminated with successfull reception of 9600-bit/s data on Friday, October 5. Congratulations to the team at Surrey and the rest of the crew

responsible for the DCE! We also would like to wish UoSat-OSCAR 9 a happy third birthday. UO-9 was launched on October 6, 1981, and is still in service.

PACKET RADIO FOR EMERGENCY COORDINATORS

The new ARRL Emergency Coordinator's Handbook, with a 20-page chapter on packet radio, is available for $5.00 from the ARRL. This book is "intended to help you acquire, develop and refine the skills which you need to function effectively in serving the public through Amateur Radio communications." The chapter on packet radio should make those in the Amateur Radio Emergency Service (ARES) aware of the traffic handling and organizing capability of packet radio. If your packet club is looking for somewhere to put on a demonstration, try an ARES meeting. If you are an ARES organization looking for an interesting meeting program, contact a nearby packet club.

MORE ON A POSSIBLE PACKET WEATHER NET

Fred W. Decker, W7ANX, U.S. Deputy Assistant Secretary for Education, has said previously that he believes packet radio and amateur meteorology can be united to form a packet-radio weather network [See Gateway #3.]. Such a network would provide some users for the growing amateur packet network, and perhaps generate some interest in amateur radio among amateur meteorologists. In a paper delivered at the First International Conference on School and Popular Meterological Education, Dr. Decker goes on to say:

"(1) Packet radio communication has emerged for amateur use as new manufacturers offer equipment enabling amateurs to communicate using their computers and [VHF radio equipment]. (2) Repeaters have recently carried packet signals 400 miles in 5 repeater jumps. This opens the possibility of local networks exchanging data at substantial distances. (3) Weather sensors feeding computers and thereby archiving data for interrogation by packet radio have come on the market from at least two firms seeing the potential in computerized popular meteorology (Heath Co. and Vaisala). (4) The drive to "Save 220" among radio amateurs seeks to populate the allocated 220-MHz amateur radio band and thereby fend off commercial intrusion, and the belief grows that weather amateurs and schools can help this cause by adopting this band (1 1/4 meters) for packet radio exchange of computerized school and amateur weather station data. With basic technical innovation completed, it remains necessary only to adopt conventions...to maximize the ease of data intergchange..."

This is an interesting project, and the fact that Dr. Decker has been discussing it with his colleagues has undoubtedly brought packet radio to the attention of many people in academia. Dr.

Noel Petit, WB0VGI, of Augsburg College, has proposed to build a computerized weather network that would communicate via telephone. The cost of his weather stations, including computer, sensors and modem, is about $300. Perhaps, with the help of some packet-radio enthusiasts, Dr. Petit's weather network can use packet radio.

If you are interested in this project, or in giving an educational demonstration of packet radio, contact:

Dr. Noel Petit

Washington, DC, 20208.

SOFTNET NEWS

We recently received an issue of Softnet News, the newsletter of the Softnet Users Group (S.U.G.). S.U.G. is a group experimenting with packet radio in Linkoping, Sweden. "The main concept behind SOFTNET is that all packets are considered to be programs in a network language. These programs are interpreted in the nodes as soon as they arrive... This approach makes it possible for a user to define his own high level services like datagrams, virtual calls, file transfers and mailboxes." [From "SOFTNET - An Approach to High Level Packet Communication", Second ARRL Computer Networking Conference.]

The SOFTNET approach could be used, with the AX.25 link protocol, to provide network services in the growing North American packet network.

SOFTNET nodes are currently implemented on four PC boards, a SOFTNODE computer board, a SOFTMEM memory board, a SOFTLINK link and modem board, and a radio board. S.U.G. is now selling PC boards, PROMS, and software for SOFTNET nodes. The builder must supply the other components needed to populate the boards. Total cost is about $600 per node. Of particular interest to those of us who operate on 1200 bit/s local networks is the fact that SOFTLINK radios/modems run at 100 Kbit/s.

The SOFTNET concept is primarily concerned with network and internetwork functions. The SOFTNET News contains two articles on network routing, searching and addressing. S.U.G. is a

growing group, moving forward quickly with packet-radio network experimentation. Their progress is sure to help packet experimenters worldwide.

TELEPORT STA INFORMATION

The waiver for automatic teleport operation requested jointly by the ARRL and AMSAT should be issued about October 17. This special temporary authority (STA) allows the operation of unattended digital gateway stations for store-and-forward or real-time satellite links. For a complete description of the STA, see Gateway issue 2. Two more stations, N2EKH and Theodore Harris, N6IIU, have been added to the list of participants, bringing the total number of authorized stations to 21. From W1UED

TECHNICAL COORDINATORS AND PACKET

The ARRL Technical Coordinators (TCs) answer technical questions, put on technical talks, and perform many technical functions within their ARRL section. Several notes in the fall issue of the Technical Coordinator newsletter indicate that many TCs are interested in packet radio. Richard Regent, K9GDF, editor of the newsletter, has received the following comments from other TCs: "[Our] greatest successful TC program is talking about data communications," and "[we have been] getting packet radio started by helping hams assemble and operate kits, and holding 2-meter packet nets."

If you are interested in finding out more about packet radio, contact the ARRL to get the name of your section's TC. Via Technical Coordinator.

NEBRASKA PACKET GROUP?

Lyman Nelson, WB0IEN, is interested in forming a state-wide packet radio group in Nebraska. Contact:

Lyman Nelson, WB0IEN
Rt. 2
Hooper, NE, 68031.

Via Technical Coordinator.

MODEM FILTER FROM EXAR

"Preliminary" data from the EXAR IC company about the XR-2103 FSK modem filter has just arrived at the ARRL. The device is designed to "perform the complete filtering function necessary for a Bell 103 compatible modem." The chip uses switched-capacitor technology to implement two 6-pole band-pass filters. One of the filters is centered at 1170 Hz, and one centered at 2125 Hz. This chip might prove useful to those using the Bell 103 protocol for packet radio on HF. Perhaps, by changing the time-base crystal, the passbands could be moved to other frequencies. If you experiment with this chip, send us a letter describing your results. Via W4RI.

PACKET FREQUENCY COORDINATION

We have received word from AMRAD president, Terry Fox, WB4JFI, that The Middle Atlantic Amateur FM and Repeater Council (TMARC), on September 24, designated the frequencies 145.01, 145.03 and 145.05 MHz for primary coordination as packet-radio channels in their jurisdiction. TMARC covers Maryland, Delaware and Northern Virginia.
Via W4RI

PACKET DISCUSSION AT THE TROPICAL HAMBOREE

If you are going to be in Florida this spring (planning ahead?), be sure to attend the 1985 Southeastern Division Convention/25th Annual Tropical Hamboree in Miami, Florida on February 2 and 3. An all-day Packet Radio Seminar is tentatively planned for Sunday, the 3rd. Paul Rinaldo, W4RI, Manager of the ARRL Technical Department, and Lyle Johnson, WA7GXD, president of Tucson Amateur Packet Radio, are scheduled to attend the seminar. More information, and a firm schedule for the seminar will be available in December. Via Dade Radio Club, Inc.

DATA BASE OF PACKET USERS

Dear Packet Radio Enthusiasts;

Several local Amateurs and I, representing Central Illinois Packet Radio User Society (CIPRUS) have started a to compile a directory of all stations who are also active on this fantastic new mode. After great acceptance and encouragement from the midwest as well as other areas, what initially was to be only a regional effort has been expanded to include the entire country.

After giving a great deal of thought as to what the best method would be to compile such a data base, we decided to contact you, the packet radio clubs and other leaders in the area of packet radio. Most of what we have compiled to date has come through direct contact with individual stations. We learned that this method involved a lot of unnecessary paper work and correspondence that could be eliminated by contacting large organizations and groups.

In order to contact as many stations as possible and to keep the costs down as much as practical we would like to propose the following: If you would send us a listing with all of the required information concerning your member stations along with a large manila s.a.s.e (several stamps please), we will, in turn, send out a compiled listing of active packet stations that you can photocopy and distribute to your membership. If you have your membership list in an IBM PC or compatible data base you can submit a diskette with the required information and have the compiled list returned on diskette. The data base is being maintained on an IBM XT in a dBase II file that can use data from nearly any standard ASCII or WordStar text file (comma delimited prefered).

Since many of us are not able to offer our services to the technical aspect of packet development, we view this project as one that will allow us to make a small contribution to the field of packet radio. We do not wish to become involved in the publishing business but rather to act only as a central point to compile and distribute data from you. We have been in contact with TAPR and have discussed the possiblity of enclosing a preprinted post card with every TAPR TNC shipped. This would allow the individual station to merely fill out the necessary blanks and return the card to us for inclusion in the directory. If you are aware of any other manufacturer of who would like to help this project, please have them contact us.

In closing I would like to present the following points for your consideration and comment:

1. This project is still in its infancy, with only about 250 stations listed to date; therefore we are open to suggestions as to what you feel should be included in such a directory. Speak up now while it is still relatively easy to modify the data base!

2. We are not aware of any other group or individual who has decided to attempt a similar venture. If you know of such a group, please put them in contact with us so that we do not duplicate efforts. We don't care who does it, just so long as it gets done by someone!

3. The directory is currently being printed on a letter quality printer and duplicated on a photocopier. As the directory

continues to grow so do the costs involved -- we are already making over 50 copies per month, with over 20 pages each. Professional printing is just around the corner. Therefore, since we are a nonprofit amateur radio club, we will not turn down any donations that you would like to make toward paper costs.

4. The format that we are using is flexible but is being currently printed as follows:

   Listing #1 -- Alphabetic, by callsign:

   Callsign; Name; Address; Misc. Info(1)
   City, State, Zip; Misc. Info(2).

   Listing #2 -- Numeric, by zip code:

   Callsign; Name; City; State; Zip Code

   The "Misc. Info" columns may contain any items (approx. 15 characters) of special information that you may wish to include. Some ideas that have been used: frequency, OSCAR, mailbox, digipeater, 24-hour operation, grid square, and gateway operation.

Thank You

Gregory L. Smith - N9AGC

Does anybody know if any of the 1200 baud diphase psk Navy fleet broadcasts from the geosynchronous UHF fltsatcom spacecraft carry UPI, AP or weather channels in some format that an ordinary mortal (very far from NSA level as a cryptanalyst) can recover with a suitable computer program ?

In the old days (late 60's to mid 70's) the Navy fleet broadcasts on hf (and lf) 85 hz shift 16 channel fsk fdm ssb used to carry 100 wpm weather circuits; sometimes special fdm transmissions to particular fleet units could be found with AP or UPI broadcast wires (from either Baltimore Md. or Norfolk Va.) on at least one tone. From time to time the UPI low speed A newspaper wire would be included also. In all cases these channels would be 7.42 (or 7.50 for AP) unit baudot code start stop at the same baud rate as they are on the wire services themselves. More recently it has been reported that certain hf fdm mux tty transmissions carry a 100 wpm AFRTS circuit which retransmits national news from both the AP and UPI radio wires slightly delayed.

It is presumably true that the signals were transmitted on hf just as they came off the wire so as not to compromise crypto security by broadcasting an encipherment of a known text. Perhaps if the Navy supplies the same stuff to it's (larger) fleet of ships these days it also sends it in the clear on the fleetsatcom psk broadcasts that are now the primary method of transmitting to ships at sea ?

I've always assumed that nothing else on the Navy fleet transmissions including the most routine UNCLAS stuff was breakable by an amateur (or even most governments), as I suppose it is enciphered by more or less the same crypto as used for high security stuff but set up from another key list. It is true, however that US low speed tty crypto systems use a start-stop to synchronous transceiver (more properly isochronous as no separate clock is transmitted) and it is at least remotely possible that certain very routine unclassified traffic is transmitted in synchronous format without benefit of a real key from the key generator (perhaps some simple sequence is used simply to keep transition density high for the clock pll). (If anyone knows, and can say anything about low security modes for unclassified traffic I would appreciate hearing from them.)

The uhf satellite transmissions are relatively high power (nearly whole transponder) signals on various frequencies between 249 and 261 mhz, they carry a 24 hour a day 15 channel time division multiplexed stream of mostly crypto circuits. The multiplexing is straight tdm with a 16 bit wide frame, each frame consists of a framing bit and one sample (bit) of each channel sent sequentially starting with channel 1. Frame sync is obtained by detecting and locking onto a continuously repeating pattern in the 16th bit position of each frame. 1200 baud divided by 16 yeilds a channel bit rate of 75.0 baud which is the standard rate for 100 wpm enciphered baudot tty traffic. It appears that the 1200 baud rate is exactly that (out to several places) so no bit stuffing is being done (understandably enough).

The modulation is differential diphase mark (phase shift of 180 degrees for every mark (one bit) and 0 degrees (no shift) for every space (zero bit)). Recovery of the data requires little more than a simple Costas loop to recover the bit stream, and a bit clock recovery circuit to regenerate the 1200 baud clock. TDM frame and bit clock recovery could be easily implemented using a Zilog 8530 SCC chip which incorperates a transition tracking digital phase lock loop. The 8530 SCC chip could be fed data directly from the phase detector on the Costas loop, as it has a NRZI mode which will allow it to recover data as it would appear at that point. Obviously the 8 bit data coming out of the SCC would represent alternate halves of the 16 bit frame, and would not necessarily be in frame sync.

The signals are powerful enough so a modified scanner (or one of the new scanners which cover the military uhf band) ought to suffice as a receiver, although the best reception might be had with a down converter and a hf receiver with medium (say 4 or 8 khz) if bandwidth. The Costas loop would connect to the receiver at it's low IF (455 khz for most receivers and scanners) after the selectivity to reduce the noise bandwidth. Antenna requirements are pretty minimal, but a small crossed yagi or helix aimed at the right point in the sky for the particular satellite of interest would be ideal.

Has anyone explored these signals ? Are there any other military satcoms (say the X-band DSCS spacecraft) which carry readable traffic ? Please reply by either US mail or posting to the net (net.ham-radio on usenet for those who may see this via gateways to other nets), as I have had no luck whatsoever in receiving email.

Can someone please enlighten me as to what the three abbreviations stand for.
And what is the difference in function between the three. One (DTMF) is the
touchtone frequencies, but I am not sure of the other two.

MAIL replies to me at IHNP4!SASK!HARDIE and I'll summarize if I am not the
only ham who doesn't know!

Tnx + 73
Pete ve5bel

The following is a list of frequencies where English language press
stations can be found on HF. This list is from personal monitoring

over the last 10 years and is not copied from any other lists.

These press stations all transmit in English, some all the time, others just occasionally.

The "SB" column indicates USB or LSB to be selected for normal copy. The apostrophe next to the L or U indicates that the station is still on the air as of the last 12 months. (I don't drop any from the list unless I am sure they are no longer on).

The "SH" column indicates the shift (Mark to Space frequency difference) used. Note that most use 425Hz shift.

The "BD" column indicates the baud rate, not words per minute. This is standard Baudot rtty code. Most foreign stations use "FIGS J" as the bell and "FIGS S" as apostrophe, which is the reverse of American machines.

The "M" in the "BD" column indicates that the station is a frequency division multiplex transmission, usually with 16 subcarriers. The shift is usually 85 Hz and many terminal units will not copy this. Receiving these fdm stations with the bfo off sounds like a buzz-saw. These stations are the best source of AP/UPI news, quite similar in format to the wire line press service sent to radio stations. The best way to tune these in is to select USB, tune onto the station from the high frequency side to the upper-most subcarrier. This subcarrier is usually the one carrying the news.

The "SVC" column shows the abbreviation of the news service.

The "CALL" column is obvious. Not all stations give identify with a call sign. Some use the same call sign on all frequencies at once, and some have calls for each frequency in use, but do not indicate which call is for which transmitter.

Not all stations of a particular service carry the same text. The VOA, for example carries as many as 4 different "programs" at the same time. the ARF, however, has the same text on all 4 frequencies at once.

I have not given times of transmissions. That is too difficult to pin down accurately. Many stations are on continuously.

The frequencies given are within 2 kHz. Some stations do slide up or down a little, reverse their mark and space frequencies on occasion, and my receiver readout does not include the amount of bfo offset (about 1.5 kHz).

Later this year, when the list is updated, I will send the complete HF rtty list, including utility stations (weather, military, embassy, etc).

Happy tuning de K9EUI

qst de k9eui
hr propagation forecast nr 42 from arrl headquarters
newington ct october 15, 1984
to all radio amateurs bt

the solar flux has been below predicted levels for more than four months, and it has run close to minimum values since early september. currently, flux numbers are more than 20 points below the 96 used for the prediction charts in october qst. thus, when 21 and 28 mhz are normally at their best, 28 mhz is useful only on transequatorial or other low latitude paths, and 21 mhz is behaving more like 28 mhz was expected to be. unless solar activity increases markedly, the rest of this year will be very different from the printed predictions, which are prepared far in advance of their appearance in qst.

as for the week ahead, geomagnetic activity was headed downward at bulletin time. dx conditions were fair to good, and will continue so through about the 16th. higher geomagnetic field activity is expected most of the time through the 25th, but the months end should be the best of the entire autumn dx season, especially on high latitude paths. if sunspot activity rises, the effects on dx in late october could be very favorable. if current flux levels continue, 14 mhz and lower frequencies will be the dx mainstays for october and early november in all but the southern tier of states.

american sunspot numbers for october 4 through 10 were between 0 and 15 with a mean of 5.9 ar

I use the 53.X frequency band for my radio controlled models and have not had any interference over the past two years.
The members of the club I am in use all of the the 53.X frequencies with no problems.

I have not bothered to switch my equipment to 50.X since I have no interference problems.

I am in Monmouth County N.J.

I can't speak for any other part of the country.

Joe Wilkes

qst de k9eui
hr arrl bulletin nr 91 from arrl headquarters
newington ct october 11, 1984
to all radio amateurs bt

fcc released a notice of proposed rulemaking , pr docket 84 960, on october 10 proposing the allocation of additional frequencies to the amateur service as follows:

the entire 10.100 to 10.150 mhz segment would be available to generals and above, on a primary basis subject to the condition that no interference is caused to fixed services outside the u.s., and no special power limit is proposed. fcc has announced that during the pendency of this proceeding, the entire 10.100 to 10.150 mhz band is temporarily available to u.s. amateurs,

a1 and f1 modes, with a 200 watt p.e.p. output limit.

fcc has proposed the arrl plan for a1 and f1 on 24.890 to 24.930 mhz, and a1, a3, a4, a5, f3, f4, f5 on 24.930 to 24.990 mhz, general and above, on a primary basis subject to the condition that no interference is caused to fixed and mobile services outside the u.s.. amateurs will also be sharing the 24.890 to 14.990 mhz band with some u.s. government fixed operations over the next several years.

fcc has proposed to make 902 to 928 mhz available to u.s. amateurs, technician and above, except for those amateurs in colorado, wyoming, and u.s. possessions in region 3.

fcc has also stated that certain government fixed operations on 18 mhz precludes amateur access to this band prior to 1989.

other matters, including 420 to 430 mhz operation along the canadian border are addressed in the nprm.

see the arrl letter and december qst for further details. comments on this proposal are due at fcc on december 17, 1984, reply comments january 16, 1985.

If Wayne gets involved packet radio will go right down the tubes.
"73" has been a joke for years and has been going steadily downhill,
thanks mainly to Wayne's "talents." Just my opinion, of course.

In case you can't tell, much of what follows is sarcasm.

It's a good thing Netnews isn't transmitted by radio; I'm certain
that some sorehead somewhere would use Goldwater's bill (if passed)
to terminate net.jokes in favor of more traffic in net.ham-radio.

> i have personally listened to
> some of this malicious interference. just one individual can
> prevent effective communications by many other persons wishing
> to use a channel.
Remember rabbit!jj and net.db?

> while noting that this type of interference is prevalent on the
> amateur, citizens, and marine band, goldwater said that it is
> also creeping into the private land mobile, public safety...
> (and even the) government communications networks such as those
> of the faa and department of defense.
Does he mean the ARPANET?

> - transmission of unmodulated carriers, recorded
> material music and threats, made directly over the ongoing
> transmissions of other operators (harold r. claypoole, n6bii,
> 1983)
Net.flame

> - long, continuous transmission of computer voice
> synthesized audio signal or ticking clock on repeater input
> frequency (henry c. armsrong, wa6cgi, 1983).
All those nonsense header lines output by malicious mailers...automatic

reports of how much news went thru what sites...who posted the most stuff
this week...what all the site names are and who they talk to...

> - whistling on frequency for a long period of time for
> jamming purposes (donald e. miller, callsign unknown, 1978)
Ever listened to a modem?

> these cases illustrate examples of the type of purposeful
> interference which this bill prohibits." goldwater said that he
> didn't intend to limit the definition of the bill's terms to
> these activities "but rather to explain the type of behavior to
> which the bill is addressed."
In other words, it's open ended and can be used against anybody.
Even you, if we don't like you.

> interference to home electronic entertainment equipment was not
> addressed in the bill.
Of course not! No ham would ever maliciously jam his/her neighbors.
They'd only maliciously jam other hams. This bill is not aimed at
protecting TV-watching citizens, only hams, of course. Hams deserve
more protection than ordinary citizens, since they've been using the
free public airwaves by exclusive license for decades now.

> s.2975 will elevate willful and malicious interference to a
> criminal offense pursuant to section 501 of the communications
> act. this section provides for both a fine of up to $10,000 and
> imprisonment of up to 1 year for a first offense and the same
> fine and up to 2 years imprisonment for repeated offenses.
Certainly the penalty fits the crime.

I am interested in the performance of the Uniden CR-2021. I see that
some of you have it.

1) How stable is it?

2) What is the dial resolution?

3) What provisions are there for external antenna(s) ?

4) Does it have a product detector, or if you don't know, does it
   reproduce SSB signals without distortion?

5) How good is the AGC and is it fast or slow?

I would appreciate any info.

     Thanks   Bob K9EUI

Sorry for the late posting of the last shuttle dope.

I usually get the bulletins twice a week off the air, Monday
and Friday nights (local time). I prefer those nights because
the propagation forecast is there on Mon., and the DX bulletin
is only on on Fri.

Because of lousy propagation, at times, and QRM, I have to do
quite a bit of editing to get "clean" copy. At times I copy
all three modes (Baudot, ASCII, and AMTOR) and still miss some
major words or info in a bulletin. Then I have to wait to get
the stuff from another source.

Quite often, the DX bulletin has stuff that is obsolete by the
time I get it on the net. THis is especially true if you can't
access the system from home and have to wait til the following
Monday. The same is true on some other bulletins, like the NASA
one. It could also be that that may have been the only new bulletin
to appear that time and I didn't feel like logging on just to
work on that one. (I get lazy at times). It does take some effort
to get this stuff out, since I have to convert from either AMTOR
or Baudot to ASCII. (Sure, our computer can do that, but I would
still have to convert the baud rate).

I do try and get the "important" stuff out as fast as I can.

A recent article in RTTY JOURNAL confirmed what a lot of us knew
all the time: Slower baud rates get thru better !!!!!!!!!!

Copy is ALWAYS better at 60wpm Baudot than the 110 baud ASCII or
AMTOR!!!!!

I never know from one day to the next which band is gonna be better
to copy W1AW on, 20 or 40 meters. Fortunately with the memories
in the 930, I can check all their freqs in a few seconds. But
usually 40 meters is clobbered by foreign SSB, and 20 may be too
weak.

I think we should start a letter campaign to the station manager
of W1AW to:

1) Move the W1AW rtty bulletin frequencies to the extreme bottom
   of the bands to minimize qrm.

2) Start transmitting on 30 meters too! This may fill in the gap
   when propagation is bad on other bands.

I am going to try diversity one of these days. Frequency diversity
is the best but it takes at least 2 copyable freqs to do it and often
there are not 2.

Well, another interesting statistic would be to look at oscar-8/7
and the RS bird usage. It seems to me that it is much easier for
the average ham to experiment with a two meter up/ten meter down
situation than it is the oscar 10 bird. I have successfully worked
several states with the oscar 8 and rs satellites using 25 watts, my
magnet mount vertical, and a piece of wire on my hf rig for a
receive antenna. Sure, there are lots of nulls in the flyby, but i
can still work them.

I realize the need, and fully support the "geostationary" or at
least the original intent of oscar 10, which permits long period of
operations. Certainly, after listening to a maximum of half hour of
the rs/oscar 8 birds, or trying to chase rare dx on the low orbit birds,
one can appreciate this philosophy. However,
i contend that, based on my experience, it is a lot easier to take
the initial plunge, using the RS birds, with no or little
expenditure, before spending much more, either in hard earned bucks
or building time, to build/acquire the directional antennas, and
high frequency gear required to operate oscar 10.

This argument may be all wet, but, i would like to see the oscar
7,8, or RS usage statistics (anyone got friends at box 88 moscow??)
to see how they are used.

RE: Meaning of DTMF

I thought DTMF meant 'ual Tonne Multi-Frequency'. Contrary to

popular usage, TOUCH-TONE and DTMF are not the same. TOUCH-TONE is what the keypad on your telephone produces. DTMF is used for sending call information from one central office to another.

I guess, since DTMF is used correctly)ly) so frequently to mean TOUCH-TONE, that DTMF will become another Q-tip or Kleenix.

By the way, the tones used for DTMF are not the same as the tones generated by your telephone 'dial'. (Check with you local phone-phreak)

RE: net.rec.rc

I would like to see a group for r/c people, but I would not like to lose contact with the radio/electronic aspects of r/c.

to all radio amateurs bt

doc will hold amateur exams across canada on october 17. the next date for examinations is february 13, 1985.

crrl has written to doc, advising of recent u.s. phone band expansion and that there appears to be considerable support among canadian amateurs for some downward epansion of canadian phone bands, particularly on 80 metres. crrl asked doc to issue a gazett notice on the subject, soliciting opinions on the matter. crrl also plans some surveys on the matter.

canadas largest amateur radio gathering, the annual radio society of ontario convention will be held in ottawa on october 5 and 6 ar

qst de k9eui
hr propagation forecast bulletin nr 39 from arrl headquarters
newington ct september 24, 1984
to all radio amateurs bt

solar flux levels of 75 or lower september 13 to 20 almost exactly duplicate a significant low in april 1977, less than a year from the end of cycle 20. looking back to september 1975 shows flux high, low and average values to have been very similar to those of september 1984 thus far.

these comparisons suggest that cycle 21 could be shorter than the 11.2 year average, but flux records available (garble) show that cycles 18, 19 and 20 all had brief periods of substantial sunspot activity in their final two years of life.

we may be on the verge of such a burst. though visible sunspot activity has been very low for the last two weeks, there is action on the sun currently. a major geomagnetic storm, in progress as this bulletin was being prepared, narrowed the useable frequency spectrum severely. things may be better soon. the solar region now facing us brought a flux rise to 93 four weeks ago. such levels in late september and in early october could work wonders for 21 and 28 mhz which could last through about october 5.

american sunspot numbers for september 13 through 19 were between 0 and 1 with a mean of 0.1 ar

Having replaced my ICOM R70 receiver with an R71A, I am interested in learning what modifications other owners have made to their R71A's.

As a contribution, I shall relate my own failed experiment. I replaced a 220K resistor on the logic board with a 47K resistor and sped up the scan rate. At this higher speed, however, the memory scan became useless, because when a signal was detected on a channel, the receiver didn't stop scanning until the next channel. In the SSB/CW/AM modes, the squelch is AGC driven, so I assume that this behavior is due to the finite AGC attack time.

The logic board in the R71A may be used in other ICOM products, because there are holes for another IC, another connector, and several other components. Maybe there are some "undocumented features" waiting to be discovered.

My R71A's noise blanker seems more effective than the one in my R70. I've also got the infrared remote control, speech synthesizer, and FM board. Anyone have any mods?

[if this line is present please report to the office]

Re schematics with electronic gear: the Shack DX-400 comes with a
schematic and costs $300; the essentially identical Uniden CR-2021
comes without one and costs $90 or $100. Take your choice.
I chose the latter; I'm trying to find out if a service manual is
available. If it's under $200, I'll probably buy it.

Some company is advertising a dx contest simulator package
that runs on a Commodore 64. When I read about it, I thought
it very funny. Imagine sitting down to your computer and
working dx all weekend without a transmitter, receiver, or antenna!
How dumb!
But after thinking some more, it sounded like fun. It supposedly
does a very good job of simulating band conditions, operator
calls, etc. As you "tune" the band (by pressing a key on the
Commodore keyboard) you encounter the "hot" operators at the
low end (the package is CW only), and the slower folks as you move up.
As time goes by, the "band"
changes appropriately. The different bands are realistic also.
A transceiver is drawn on the monitor screen.
The part that intrigued me the most was that you could enter your

location and have the whole thing be appropriate for that place.
For instance, you could find yourself on a rare island and
in the middle of constant pileups. The package constantly
displays statistics so you can see "how you're doing"
and so you can compete against others. In fact the company
is going to give "awards"! Another feature is
realistic responses from the "stations" you work. They
respond to QRS and requests for repeats, etc.
Has anybody out there actually tried this thing? I'd like
to know if it is as realistic as it is supposed to be.
It might be fun, and could certainly be used as a tool
to train oneself for contest operating or to just "brush up"
on skills.

CONTEST

The Columbus (Ohio) Amateur Radio association will be having
their second annual "Columbus Day Special Event". This
event is open to amateurs worldwide. Please see inclosed
rules. Hope to see you on the air..... 73 gws N8EMR

COLUMBUS DAY SPECIAL EVENT
OFFICIAL RULES (1984)

1) Eligibility:

Open to all amateur radio operators worldwide, divided into two separate groups.
1> Columbus, Ohio amateurs (including area suburbs)
2> All other amateurs worldwide

2) Objective:

The overall objective is to promote the explorer Christopher Columbus, the city of Columbus,Ohio and amateur radio operators worldwide.

Columbus hams are to work Columbus hams and non-Columbus hams in a relaxed manner.

Non-Columbus hams are to work Columbus hams as required for a certificate.

3) Date/Time:
Band/Freq

1> Saturday, October 06,1984
1400z to 2400z
15 Meters Phone @ 21.375Mhz +- 10Khz
2> Sunday, October 07,1984
1400z to 2400z
40 Meters Phone @ 7.240Mhz +- 10Khz

4) Exchange:

A valid exchange shall be Name, QTH and RST. Columbus hams, should include info on certificate.

5) Scoring:

1> One point for each contact (excluding W8TO)
2> Six points for a W8TO contact

6) Final Score:

A final score of TEN (10) must be submitted to be eligible for certificate. Scores must be submitted within 120 days to be valid.

7) Certificate:

Certificates will be issue to all qualifying amateurs who include an SASE (SAE, 3 IRC's ok for DX.) SWL's may receive the certificate on station heard basis.

8) Awards:

A mini contest will be in operation during the event period; The highest score from a Columbus amateur. will receive a plaque for their effort.

9) Address:

All requests for certificates and correspondence should be sent to:

The product you're referring to is called "Dr. DX" and is sold by
AEA. I learned about this wonderful little gimmick during a visit
to ARRL HQ the other week.

It turns out that the AEA people love to play practical jokes with
this thing, and it is remarkable how many people they had absolutely
fooled at Dayton. One Japanese amateur radio company representative's
eyes almost popped out when he apparently saw the AEA guy working
a DX pileup using a ball-point-pen as the "antenna".

Perhaps this says something about the intellectual challenge level
of working CW DX?

UB 40

I think the Dr. DX thing sounds like a neat thing too. In the summertime, I always get rusty, I know. I'm sure that it does say something about the intellectual challenge of working CW DX, but then, I am pretty satisfied about the intellectual challenge of my job, and CW DX is a nice way to relax. Sort of like those

who are members of the Society for Creative Anachronism. Not
too intellectual, but I've never talked to one of those guys who
didn't love getting beat over the head by Sir Lancelot.

Re KA5MJQ's reference to technical lit on broadcast-band auto radio
antenna matching and possible applicability to HF rcvrs:

The front-end design in broadcast-band car radios is completely
different from that in HF rcvrs. This is due to the fact that in a car
you're using a 3-foot long antenna to rcv signals whose quarter-wavelength
is several hundred feet. In a car radio, the capacitance of the antenna
coax (coax mandatory for noise shielding) and of the antenna itself is
part of the RF-stage tuned circuit; that large amount of fixed C is why
the radio must be inductively tuned and why proper front-end tuning
(i.e. setting trimmer cap) is critical.

                        Dan, K1DK

The Antenna Adjust knob on the CR2021 probably does what most antenna
tuners do, control a variable capacitor or inductor (probably the latter),
forming 'transformer' which is used to match the input impedance of the
radio, (probably 30-50 ohms) front end, to the impedance of the antenna
(which varies with frequency, and for a short whip is probably several
 hundred ohms).

From comparing the 'sound' of the filter on the CR2021 with my McKay
Dymek DR-101, I would suspect 4Khz/8Khz as the filter widths, although
it could be 3/6 as well. The 'narrow' is definetely less than 5Khz,
which is a standard 'station spacing' on shortwave.

The RF attenuator acts like about 10db per step, (which is pretty
standard for attenuators).

The 'fine tune' knob controls the frequency of the BFO, which is totally
divorced from the IF tuning frequency generated by the digital synthesizer.
I suspect getting it to act as fine tuning on AM is difficult.

                              -JCP-

Here is a predicted element set for orbit 23 of the upcoming Challenger
mission. Note, however, that it was based on an October 1 launch and needs
to have its RA (right ascension) of the ascending node adjusted for the
actual launch time, which I believe is currently scheduled for October 4.

```

```

The high inclination of this mission will make the orbiter visible at much
higher latitudes than most shuttle missions. It will also make it possible
for more amateurs to receive the 435 mhz transmissions of a Getaway Special
experiment that will be mounted in the cargo bay. Tracking the shuttle,
however, has always proven to be extremely difficult due to the unpredictable
drag effects of the low orbit and the constant perturbations of maneuvering
rockets. As we found with STS-9, predictions made from element sets which
were only a day old could be off by minutes.

Phil Karn

Gateway: The ARRL Packet-Radio Newsletter
Electronic Edition
Volume 1, Number 4
September 25, 1984.

ARRL DIGITAL COMMITTEE MEETING

The ARRL Ad Hoc Committee on Amateur Radio Digital Communication met in Newington, Connecticut on September 14, 15 and 16. [See issue 3 of Gateway for background on the Digital Committee.] Twenty packet-radio enthusiasts (committee members and observers) were present for the meeting. The group addressed the state of amateur packet radio; link-layer protocols; and approaches to packet-radio networking.

The following items summarize the results of the weekend's meetings.

DIGITAL COMMITTEE APPROVES AX.25 SPECIFICATION

During its meeting on September 15, the ARRL Ad Hoc Committee on Amateur Radio Digital Communication approved a specification of the AX.25 link-level protocol. This clears the way for submission of the protocol to the ARRL Board of Directors for their approval.

The approved specification of AX.25 was written by Terry Fox, WB4JFI. The protocol is essentially the same as that implemented on all of the TNCs now on the air. Major changes from previous versions of AX.25 concern the poll/final (P/F) bit and multiple digipeaters. The specification includes the P/F bit resolution proposed by Phil Karn, KA9Q [See July, 1984 QEX]. The use of multiple digipeaters, as permitted on most available TNCs, is now part of the "official" protocol. Neither of these changes will make the specified protocol incompatible with existing implementations.

The ARRL Board of Directors will consider AX.25 at its next meeting, in October of this year. Board of Directors' approval will create a published, international standard protocol for amateur packet radio. With such a standard in existence, commercial manufacturers will be able to design products for packet radio, confident that their products will be compatible with others'.

23-CM BAND PLAN COMMENTS

The Digital Committee also considered the matter of UHF band plans. After some discussion, the committee endorsed the ARRL VHF/UHF Advisory Committee (VUAC) band plans for both 23 cm and 33 cm. The committee noted that the Southern California Repeater and Remote Base Association (SCRRBA) 23-cm band plan also includes sufficient

frequency allocations for digital communication. The digital allocation in the SCRRBA band plan is not on the same frequency as that in the ARRL band plan, but this should only cause slight problems on links going into and out of Southern California.

PACKET-RADIO NETWORKING

The next step in the development of amateur packet radio is the specification and implementation of a network-layer protocol. The network layer is responsible for routing packets from their originator to their addressee through a number of intermediate stations. There are currently two network protocols being proposed for amateur packet radio. To help decide which of these protocols is better for amateurs, the Digital Committee had a "brainstorming" session. The session provided an interesting look at the future of amateur packet radio. Some of the points made during the discussion follow:

- A user should need only a TNC to access the network.
- The network should be easy to operate.
- The network should support a wide variety of media (HF, VHF, microwaves, meteor scatter, etc.).
- The network should remain amateur in spirit.
- The network should work when commercial networks are down; in the event of emergency, the network should still be available.
- Network users should be able to specify their needs (for example, a choice of speed over reliability).
- The network should be able to resist jammers.
- The network should be able to take advantage of new stations when they come on the air, and should not be crippled by stations leaving the air.
- The network should support traditional amateur operating modes, rather than forcing amateurs to change their habits.
- Both real-time and store-and-forward operation should be supported.
- Controlled broadcast, or alert should be

available.

- Roundtable operation should be supported.

- There should be a network directory available on the air.

- Fault detection and isolation should be easy.

- The network should function well in various geographical regions.

- There should be a mechanism for monitoring the performance of the network.

- There should be no user "passwords" or other "authentication."

- The network should be data transparent; whatever data is sent from the source should be received unchanged by the destination.

- The network should be global.

- The goals set for the network should be attainable within the limited, amateur resources available.

This is an ambitious set of goals. The Digital Committee feels that, given the proper approach and efficient use of available resources, these goals are attainable.

After the brainstorming session, the committee heard tutorials on the two proposed network approaches, datagrams and virtual circuits. A very brief summary of each approach follows.

Each packet sent through a datagram network is routed independently of any preceding or following packets. This routing system is very robust; if stations join the network, they can be immediately taken advantage of. If stations leave the network (as long as a path exists from the source station to the destination station) communications will not be interrupted. There is a price which must be paid for this robustness: each packet must contain extensive information needed for routing. The datagram protocol being advanced for amateur packet radio is the Defense Advanced Research Projects Agency (DARPA) Internet Protocol (IP).

In a virtual-circuit network, a route is established between the calling station and the called station at the beginning of a QSO. This route is called a virtual circuit or a virtual connection, and is used by all of the packets in the QSO. Only the first or call-setup packet must contain complete routing information. Once the virtual circuit is established, subsequent packets need only include a

virtual-circuit number. If one of the stations in the virtual circuit becomes unable to handle traffic, another call-setup packet must be sent, and another virtual circuit set up. Note that most packets will not be call-setup packets, and will contain minimal routing information. This is one of the advantages of the virtual-circuit approach to networking. The virtual circuit protocol proposed for amateur use is called AX.25, and is set forth by Terry Fox, WB4JFI, in the Third ARRL Amateur Radio Computer Networking Conference proceedings.

These descriptions do not fully describe the protocols under consideration, nor do they capture the scope of the discussions that took place during the Digital Committee meeting. After almost two days of discussion, there were still proponents of virtual circuits, proponents of datagrams, and a number of undecided individuals.

The Digital Committee has no desire to force a protocol upon any group. Because of the number of people in the undecided camp and the number of points in favor of each type of protocol the committee decided that the packet community would best be served by a period of experimentation, during which both datagrams and virtual circuits would be implemented and tested.

Several members of the committee stressed the importance of implementing the protocols in a transportable high-level computer language. This would allow the programs that are developed to be run on many computers. The people who are going to be doing the programming decided to use the "C" programming language. In order to test the two protocol implementations, they must operate in the same environment. The test environment chosen by the committee is the Xerox 820 computer, modified to use an HDLC chip and run at 4 MHz. These decisions are not meant to stifle network protocol experiments. They were intended to foster program transportability, and to provide a common environment for testing protocol performance.

The identification of network objectives, the discussion of protocols, and the formulation of an experimental approach are the first steps toward the implementation of a world-wide packet-radio network. If you are interested in the network protocol experiments, contact a member of the ARRL Digital Committee [See Gateway #3.] and get started!

EUROPEAN PACKET ACTIVITY

Several European observers were present for the ARRL Digital committee meeting. They were: Hanspeter Kuhlen, DK1YQ, from AMSAT-DL; Ian Wade, G3NRW, from the British Amateur Radio Teleprinter Group (BARTG); John Sager, G8ONH from the RSGB; and Alan Jones, G8WJM, from the Cambridge Computer Labs. The primary duty of these observers was to learn about the state of amateur packet radio in the U.S., but they also provided us with some news about packet radio overseas.

Germany: In West Germany, several TAPR TNCs have made it through customs into the hands of the new Bavarian Packet Radio Group. There should be twenty or more packet stations on in West Germany by the time you read this. Unfortunately, there are some German regulations that will slow the development of packet networks; no two repeaters may be linked together, and no third-party traffic may be passed. Hanspeter was confident that these hurdles could be overcome. For more information on the Bavarian Packet Radio Group, contact:

Thomas Kieselbach, DL2MDE
Narzissenweg 10
D-8031 WESSLING
W-Germany.

England: The RSGB, in conjunction with BARTG, has formed a Packet Radio Working Party. The aims of the group, chaired by Dr. Dain Evans, G3RPE, are : to clarify what is meant by Packet Radio in the amateur context; to determine what form Packet Radio is likely to take in the UK, and to compare this with activity in other countries; to determine how packet repeater proposals are to be handled; and to determine the requirements for possible changes of the license regulations to exploit the capabilities of Packet Radio to the full. The Working Party has held two meetings, and adopted AX.25 as a standard for the UK. The BARTG newsletter Datacom is a good source of information on packet radio in the UK. Write:

Ian Wade, G3NRW
7 Daubeney Close
Harlington
Dunstable
Bedfordshire
LU5 6NF
UK.

There are already thirteen stations running AX.25 packet radio in the UK, and several dozen others are actively interested. Expect to hear UK packet stations on Oscar-10 or HF any day now.

Via DATACOM

PACKET RADIO ON JAPANESE SATELLITE

Sometime between 1985 and 1987, the Japan Amateur Radio League (JARL) and JAMSAT will be launching the first all-Japanese amateur satellite, JAS-1. Along with a Mode-J transponder, JAS-1 will carry a store-and-forward packet-radio transponder. The packet-radio transponder will operate at 1200 bauds, FSK, with an uplink in the 2-meter band, and a downlink in the 70-cm band. The designers of the satellite have agreed to use the AX.25 link-layer protocol, strengthening the protocol's standing as an international standard.

PHASE III C AND PACKET RADIO

If the amateur satellite fraternity is able to fund the launch of a Phase-III C satellite, that satellite might carry a packet radio

transponder. The ability of the satellite to carry such a transponder will be regulated by three factors: kick motor capacity, space available, and power available. If the proposed steam-propelled kick motor is used, there should be both the motor capacity and space available to launch a digital transponder. The power-consumption limits placed on the design of the transponder would make most of the existing technology useless, since existing high-level data link control (HDLC) chips draw too much current for satellite application. The use of software to transmit and receive packets through CMOS serial I/O devices is under consideration. A packet transponder for Phase-III C is not a high-priority item for AMSAT-DL, but it is under consideration. Via DK1YQ

PACKET COLUMN IN RADIOSPORTING

Yuri Blanarovich, VE3BMV is hoping to start a new amateur-radio magazine called Radiosporting. He plans to make it "for active radioamateurs, filled with timely information that would be of interest to many involved in operating and competitive aspects of amateur radio." One of the columns in Radiosporting will be devoted to RTTY, AMTOR and packet radio. If you are interested in subscribing to Radiosport, or contributing to its packet column, contact:

RADIOSPORTING
Box 65
Don Mills, ON, M3C 2R6
CANADA.

MORE NEWS ON HIGH-SPEED PACKETS

We received the following letter from Richard Bisbey II, NG6Q:

"The Information Sciences Institute Amateur Radio Group (WB6MXZ) has been on the air with a 56 Kb packet radio system since December, 1983. The equipment consists of 8088-based controllers using the Zilog 8530 SCC chip and frequency agile 10-watt FSK transmitters and receivers. The controller supports serial, parallel, and Ethernet connected devices. Assembled controllers cost approximately $650. The system uses standard INTERNET (IP/TCP) protocol, and in addition to supporting simple link level connections, supports internetworking as well as numerous high-level protocols such as TELNET, File Transfer (FTP), Mail (SMTP), Multi-Media Mail (MMM,MPM), Graphics (GP), Packet Voice (NVP), and Remote Virtual Disk (RVD). The hardware and software can support data rates as high as 1 Mb, well in excess of the current amateur limit of 56 Kb.

"Previous packet radio accomplishments by ISI amateurs include a March 1982 demonstration of transcontinental packet radio internetworking between an aircraft flying above Los Angeles and a fixed station in Virginia, and a November, 1982, demonstration of intercontinental internetwork packet radio communications between Los Angeles, California and The Hague, Netherlands using Intelsat-4A. The ISI

group is currently developing a low-cost spread-spectrum system with capabilities similar to the current non-spread system."

SEATTLE, WA PACKET CLUB

The Seattle-Tacoma area packet radio users recently decided to become a formal organization. The actual formation of the club will take place October 13, 1984, at 1300 Pacific Time in the Boeing Employees' Amateur Radio Society meeting house. The club constitution will be a slightly modified version of the NEPRA constitution. The first large-scale goal of the club will be linking of the Seattle-Tacoma-Everett area to Vancouver, BC; Portland, OR; Spokane, WA; and Moscow, ID. Via KD7UW

PACKET RADIO IN GEORGIA

The Georgia Radio Amateur Packet Enthusiasts (GRAPES) club was formed on September 14. Their network name? GRAPEVINE, of course. They are interested in setting up repeaters to link Georgia with the Carolinas, Florida, Alabama and Tennessee. They would like to hear from packeteers in those areas. One possibility that they are examining is a repeater location on Brasstown Bald, a 4,784-ft mountain on the northern Georgia border. For information, contact:

Dennis Barrow, WB4GQX
Rte 7 Heard Road
Cumming, GA 30130. Via W4RI

ABSTRACTS

As space permits, and interesting articles come to our attention, Gateway will print abstracts of articles found in other journals and newsletters. If you know of an article that should be abstracted, drop us a note and a copy of the article.

"HF Packet Frequency Specification," by John Langner, WB2OSZ; NEPRA Packetear, Issue 14. This one-pager addresses the problem of frequency specification for FSK stations on HF. It proposes that the radio frequency midway between the mark and space frequencies be used when discussing the operating frequency of such stations.

"Routing Strategies in Computer Networks," by Hsieh and Gitman; Computer, June, 1984. This article addresses the question of routing. It sets forth some algorithms for determining the best route from one node to another, and discusses the application of these algorithms to various types of computer networks. Since it addresses routing in both datagram and virtual-circuit

networks, this article is particularly interesting to people concerned with amateur packet-radio networking.

During the last week of playing with a new ICOM
R71A
receiver, an MFJ active indoor antenna, and 25' of wire
wrapped around the inside bedroom window frame, I've logged
the following stations (all frequencies in MHz):

- Russian Aeroflot Airlines 15.024 CW (commercial flights
to Cuba)

- Ship-to-Shore duplex radiotelephone stations WOM (13.1163/12345.5 USB) and WLO (13.1349/12.3641 USB)

- MacDill AFB (FL)- 11.243 USB

- USAF Strategic Air Command - 11.243 USB

- USAF Tactical Air Command - 11.214 USB

- USAF Global Command & Control System Stations - AFCC/ATOS:

  o+ Albrook AFB (Panama Canal Zone) 8.993 USB

  o+ Scott AFB (IL) 9.014 USB

  o+ McClellan AFB (CA) 15.031 USB

- North American Aerospace Defense Command (NORAD) 9.023 USB

- Canadian Military Aeronautical Communications System (MACS) wx broadcasts from Edmonton 15.035 USB

- Dozens of cordless telephones, some as far as 2 miles distant: 1.660 - 1.830 FM

--

*** REPLACE THIS LINE WITH YOUR MESSAGE ***
<obligatory line-eater sacrifice>

In reference to the orbital element state-vector, does someone have an
easily transportable algorithm (or program, even) that will give longitude/
latitude predictions, visibility/altazimuth, etc? I know I'm asking a lot,
but it sure would be neat. I know the ham elements out there must have some
such thing, but I haven't subscribed to QST in some time, now. Anybody seen
anything like it? I have a PC-compatible, Turbo Pascal, and even (choke, gag!)
MS Basic.
   Thanx for listening (reading?).

Thanks to everyone who responded to my question about VXOs. Here are
some results:

First, I added a series inductor with the xtal and variable capacitor.
This did not help at all. In fact, the FT-243 xtals seemed to be have
trouble oscillating at the extreme tuning range (still about 1 KHz).

Following a recommendation to try xtals in the HC6/U package, I called
JAN Crystals Co. Their "technical person" said that there was no difference
in the cut of xtals in either package and could not guarantee that one would
work better than the other for this application.

I decided to see for myself by ordering two xtals in an HC17/U package
(same as HC6/U but with pin dimensions compatible with the F-243 socket).
Success! These xtals could be pulled about 4 KHz without a series inductor.
I am hopeful that the inductor will extend this somewhat.

For your information, my QRP rig is based on a series of articles in 73
Magazine. I would recommend this circuit to anyone interested in building
such rigs because it is simple, has fairly high output power (8-10 W), and
all of the parts except for xtal and variable capacitor are available from
Radio Shack. The inductors are made by removing turns from R.S.10 and 100 uH
chokes.

The articles are as follows:

Feb. 81 - 80 & 40 m VXO transmitter.
Feb. 82 - VFO for above. I tried this, but it was chirpy and coupled power
              supply ripple very well.
May 82 - 20 W amplifier. Probably not worth the effort for only 3 dB.
Jan. 83 - 20 & 15 m versions.
July 81 - Companion receiver. I don't know anything about this.
Mar 83 - VERY IMPORTANT. Corrections to procedure for making the inductors from
R.S. chokes.

Even with the limited tuning (1 KHz) and a dipole, I have worked about 15 states
and the U.K. over a 1-2 month period.

Thanks again,
Jim Boddie NG2J

To answer W3IKG, sorry, I don't know where there is a Matchbox for sale at this time. I have seen some at hamfests recently, mostly the smaller 275 watt version.

I have the smaller one and use it with a 1000 watt (dc input) amp all the time with no smoke or arcing. Of course I tune up with just the 100 watt exciter first. The only real difference between the Matchbox and the balanced tuners in the handbook is Johnson's use of the dual differential capacitor which is an unavailable item. Without this cap, you have to tap down on the coil for proper loading and also be able to select series or parallel feed, but the handbook circuits work just as well.

I don't know too many people using vertical dipoles but that is a good way to go. That reminds me of my experience with my low freq antenna which is a 40 meter inverted v fed with open wire line. The antenna works much better on 75 and 160 meters when the feeders are tied together and the system is fed like a single wire. It then becomes a top capacity hat loaded vertical. Naturally it is better if you have radials, or like they used to do in the old days, a counterpoise wire.
A horizontal dipole just does not work well if it is under a quarter wave above ground.

I remember an article in a 1920's QST that used a 3-wire open line feeder. The tuner also was used to shift the current point to different locations on the antenna to optomize the angle of radiation. I hope to find that article again and try it out.

hr arrl bulletin nr 84 from arrl headquarters
newington ct september 28, 1984
to all radio amateurs bt

at the fcc open agenda meeting on september 26, a segment of
the amateur 13 cm band was assigned to the aviation services
for flight test telemetry stations. the fcc adopted a report
and order in general docket number 84 186 that will assign 2310
to 2390 mhz to test flight telemetering stations under part 87
of the commissions rules.

part 97 of the amateur radio rules, has not yet been affected.
however, this action is one of several in a string of
procedural assaults on continued amateur occupancy of the 2310
to 2390 mhz segment. arrl will continue to oppose any
elimination of amateurs secondary status in this segment.
details will appear in qst ar

qst de k9eui
hr propagation forecast bulletin nr 40 from arrl headquarters newington ct october 1, 1984
to all radio amateurs bt

solar flux data for july through september make a good case for last weeks statement thast the end of solar cycle 21 could be near. the flux high for july was 93. the first 93 of the rising cycle came in february, 1977. the september average, 78, relates to march 1977, in the same way. the weeks low, 79, was last seen in november 1976, when cycle 21 was a mere four months old.

if fall dx results thus far have been below expectations, it could be because the qst charts from july on were based on solar flux values between 12 and 17 percent of those actually observed. this condition now seems leikely to apply to the charts in october qst as well.

the past week did not bring the rise that had been indicated by new solar activity observed one solar rotation earlier. instead, the solar flux staggered along in the low seventies, then dropped to an eight year low of 79 on the 20th, but no large upswing is expected. rather the prospects are for generally poor conditions through october 3. the beginning of the forecast week should be quite good, but with continuing low maximum useable frequencies.

american sunspot numbers for september 20 through 27 were between 0 and 9 with a mean of 3.1 ar

Relayed from the ARRL:

STS-41G Keplerian Element Sets for GAS 007 Planning

Launch: October 5, 1984 at 11:03 UTC.

I.D. Planning Set # 1-B (First Downlink)
Epoch 84/280.85347222
Drag 7.6E-02
Inclination 57.2007
R.A.A.N. 73.8280
Eccentricity .0010544
Arg. of Perigee 346.2766
Mean Anomaly 14.1415
Mean Motion 15.97849766
Orbit # 23

I.D. Planning Set # 2-B (Second Downlink)
Epoch 84/281.84930555
Drag 8.4E-02
Inclination 57.1942
R.A.A.N. 69.1449
Eccentricity .0007995
Arg. of Perigee 345.4320
Mean Anomaly 17.6465
Mean Motion 16.16455877
Orbit # 39

I.D. Planning Set # 3-B (Third Downlink)
Epoch 84/282.83678240
Drag 8.0E-02
Inclination 57.1865
R.A.A.N. 64.3691
Eccentricity .0008229
Arg. of Perigee 359.4947
Mean Anomaly 0.5436
Mean Motion 16.15978125
Orbit # 55

Note: These sets have been adjusted to match the design flight profile
to within approximately 10 seconds for each downlink period. An
error of several minutes can accumulate for propagation beyond these regions.

I ams, and  trying to put together a few things on my own and keep running up
```

again the problem of inductors (and transformers) not being as availiable
as R's and C's. What do most people do to cope with this problem. I
assume that you wind your own but there are many things required to do
this. Cores, wire, and slugs are to name a few. Not to mention some
sort of charts which tell you which core, wire, and windings to use to
get the size that you want. (I know that straight physics of the problem
would result in a very poor approximation to this problem). Is there
a kit sold by someone which has all the goodies needed to build your
own inductors with reasonable accuracy? Are there other solutions to the
problem?

I would prefer that you mail your responses directly to me and I will
post a summary if requested.

Perry

The DX column in the October QST has an unsolicited review of
Dr. DX.

If you are interested in talking to someone who has used the latest version
of Dr. DX, call Mike (NI0E) at Colorado Amateur Radio (303 841-8444).
He will be happy to tell you all about it.

73,
Steve, N2IC/0

I wholeheartedly endorse the KT-34XA.
It typically outperforms my monobanders.

A word of warning about roof-mounted tripods, however:

I used the South River 15 foot tripod for 3 years when I lived
in New Jersey. It is not intended for use with ham radio
antennas (as the manufacturer will be happy to tell you).
I had a Wilson 3-element tribander on top of it (not a particularly
large antenna). In addition to anchoring the tripod into the roof,
I had one set of guy wires set into the roof rafters.
Despite this precaution, I experienced many problems with
damaged cross-members in the tripod (i.e. they would break due
to twisting of the tripod). Also be warned that without modification,
the rotor mounting in the tripod is not large enough to accomodate
a "normal" sized ham rotor (i.e. HD-73, Ham-4, etc.), and the
opening in the top of the tripod will not accommodate a standard
2" mast.

In summary, the South River roof tripods are, at best, a temporary
solution (2-3 years), which will require considerable maintenance
(usually in mid-February when the weather is at its worst).

I think the idea of an FCC auxilliary is a good one. After all, hams are doing the testing now so why not.

However I really wonder how well it would work.

Last year we had a couple jammers on several Northern Illinois repeaters. We caught one of them, so we have his name and address. (Stupid jerk had a CB receiver connected to a 2 meter rig and let the vox kick on the 2 meter rig on our input. This went on continuously for 2 days). We called the Chicago FCC office and were promised help from a field engineer, which never happened. I wrote to a Senator, a Congressman, and the head honcho of the FCC in Washington. So far all we got is the promise that the FCC will now take the word of a repeater trustee that a violation has occured (they no longer have to hear it themselves).

I gess my point is that I have seen no action yet, even though the name and address of the offendor was given them. The same is true of a 27.5 MHz ssb'er. One I heard was dumb enough to give his address over the air. I told the FCC about him too, and nothing has been done.

As I see it, funds for the FCC have been cut so badly they don't have anyone to do enforcement work. What's the solution?

Subject: White House Communications

For what it's worth department, August 6 AW&ST had a note that:
"Defense Communications Agency plans to lease commercial Ku band
"Satellite service for White House Communications and has requested
"bids by mid-September. The contractor is to supply six portable
"satcom terminals that can be disassembled and shipped by commercial
"or military aircraft. Each terminal is to be capable of offering
"256 kilobit/sec capacity to permit encryption."

Sounds like something beyond the suitcase-sized comm, but maybe the suitcases will link into these "portable" terminals in the same city as the President. Either way, it doesn't sound like something the aficionado would be able to hear, but for those who asked last month, perhaps its a measure of the security used for such potentially critical communications.

73's,
Chris WD5IBS

The first session of the University Amateur Radio Clubs net will be on October 8th, 0100 UTC (Sunday evening 8:00 p.m. EST) on 3905 khz, +/- QRM. Net control will be K9IU at Indiana Univeristy in Bloomington, IN.

The intent of this net is to provide a means for club stations at various campuses to communicate with each other and exchange information that is felt to be of interest to the other club stations.

This initial net will be a "get acquainted" session for the clubs. An exchange of size of clubs, type of equipment, club activities and projects, problems, etc. will start the net off. After the introductions, be ready to express your ideas on what you (your club) would like to see happen with this net. We realize that 75 meters may not provide as wide a coverage as everyone would like. Suggestions for alternate frequencies or times will be accepted.

I hope to meet all of you on the net.

I went out and bought the DX-400 for about $200 a few months ago. What I'd like to know is whether there is any difference

at all between the DX-400 and the CR-2021.

A friend of mine is very anxious to get the DX-400. Wouldn't
he be a lot better off getting the Uniden?

Why is ICOM'S 250 Hz Filter Cheaper Than Its 500 Hz Filter?

ICOM offers 2 narrow CW filters for the 9 MHz 1st IF in
the
R71A general coverage receiver:

1. FL-32 (500 Hz @6 db, 1.5 KHz @ 60 db). Price = $60.

2. FL-63 (250 Hz @6 db, ? @ 60 db). Price = $48.50.

The 500 Hz filter worked ok in my older R70. Why is
the
more narrow filter CHEAPER? Does anyone have any experience
with either filter in the R71A?

It's doubtful that you could say that someone would be "better off" buying
the Uniden CR-2021 than the Radio Shack DX-400. They are essentially the same
radio, with minor cosmetic and S-meter differences. The main difference is the
price and warranty situation. You trade off the Radio Shack warranty and easy
access to service for buying by mail order at a much lower price. (Unless
you happen to be located in the area of one of the Uniden discount sellers.)

It's been my experience that modern electronics that work when you turn them
on continue to work, at least through any warranty period. Only long
extended (5-year) warranties on expensive hifi gear seem to be worthwhile
to me, so I personally discount the advantages of buying the Radio Shack.

By the way, in addition to the two $89 sources of the Uniden previously
posted (Missouri Radio Center & National Tower), Grove Enterprises is now
selling it at $99 with free UPS. EEB still is including the free headphones
but charges for UPS. Competition reigns...

I don't understand the "ham vs SWL" at all. I have received SWL cards from as far away as USSR and Czechoslovakia and the SWL cards and quite similar to the QSL cards that all "hams" enjoy receiving. The SWL people in the US should also send SWL cards. Maybe not to US "hams" but at least to "hams" operating outside the US. This "ham vs SWL" is getting to be "snob" oriented.

Some comments that I have read, look like they came from EX-11 meter people (CBers). TSK TSK.

My new Yaesu FT-209RH has the same problem after it 'warms up'. More specifically, after being in QSO for several minutes the transmitter tends to want to stay keyed for 0.5 - 1.0 seconds after the PTT switch is released. What is really interesting about it is that it does this only when 'warm', and only after speaking into the microphone (external speaker/mic, too). Just keying and releasing the PTT switch won't make it happen. The demo FT-209RH at the local ham emporium does not have this problem. Anyway, my radio is currently at the Yaesu repair center in California where the problem hopefully will be resolved. As soon as I find out what the problem is, I'll post it to the net. Perhaps the phenomonon in the Icom is similar to the Yaesu's and may have a similar cause.

Hello, net.ham-radio !

I have been reading this newsgroup for only a week, and find
it very interesting(although largely incomprehensible), and I
have a general question; how does one "get into" ham radio ?

I have a background which gives me some knowledge of electronics
and electricity, and a bit of telecommunications, and would like
to find out if this fascinating hobby is for me.

My only experience with two way radio communications is the CB
in my car.

Is there any particular reading which would be enlightening to
a novice ?

Any help would be greatly appreciated.

Thanks in advance

Regards;
jim

Jim:

It is nice to hear of people who are interested in getting into ham-radio. I have been a ham about 8 years and have spent many enjoyable hours(much to my wife's annoynamce) at the dials of my rig.

I can understand your comment about not understanding the contents of the net-news articles, as in all hobbies, jobs, etc the jargon sometimes gets almost non understandable.

To get information about getting into ham radio some suggestions which may or may not apply to your personal situation but should get you on the way:

1. buy (or go to library) a copy of one or more of the the following mags. , QST(publication of the ARRL (American Radio Relay League--a ham oriented organization which some hams join--i did), 73, HAM RADIO and others. These publications have articles about the hobby as well as adverts. about equipment--to get an idea of the cost of getting into the hobby.
2. Contact a local ham club--some clubs have a telephone number listed in the telephone directory. Some clubs have classes for new hams or classes for upgrading for licenced hams.
3. Attend a local ham-fest(a ham,electronics,computer,junk) flea market.
4. If you know a ham ask him to help get you started, most hams enjoy being an "Elmer"(a ham jargon term for a ham who helps a new ham thru the steps necessary to get his "ticket").
5. The ARRL publishes a number of primer type books which can sometime be found in bookstores, their licence manual is pretty good. The books can be ordered from ARRL via coupons printed in QST.
6. I hope this has helped--I have not coverd all the avenues but at these are the way that come to mind at this time.

   73(more jargon for best wishes-and other nice things)

     The Navy - Marine Corps Military Affiliate Radio System (MARS)
is a Navy Department sponsored emergency communications system
available to military and civilian disaster officials during
periods of emergency. A primarily volunteer organization, MARS is
unique within the Naval establishment. The Commander, Naval
Telecommunications Command is the central coordinator in carrying
out MARS responsibilities.

     Although a military system, MARS is closely related to Amateur
Radio. An amateur radio operators license is a prerequisite for

affiliation, and the system relies on the expertise of its 3,000 volunteer amateur radio operators who use Navy telecommunications procedures. All MARS operations are conducted on military assigned frequencies.

Although no major communications outages resulted from Hurricane Diana's erratic activities, Navy - Marine Corps MARS "stood at the ready" throughout the storm's life. 140 volunteer MARS members from Florida to Virginia participated, each with their own equipment, for a total of 3,400 man-hours. The rate for this service, if purchased, would be more than $100,000.

The National Communications System (NCS), a confederation of federal agencies and departments established by Presidential Memorandum, is responsible for ensuring that critical telecommunications needs of the Federal Government are met during any emergency. Since entering into a memorandum of understanding with NCS on 17 Nov 83, Navy - Marine Corps MARS offers organizations providing emergency services a reliable alternative to costly equipment purchases and personnel assignments.

If you are a U.S. Citizen, age 14 or older, with an Amateur Radio Operator's license and would like to know more about Navy - Marine Corps MARS, contact: Chief, Navy - Marine Corps MARS, 4401 Massachusetts Avenue NW, Washington DC 20390.

WB6NLL Note: Navy - Marine Corps MARS operates a worldwide RTTY message traffic system and a ship/shore phone-patch service for naval personnel afloat and overseas. To participate in Navy - Marine Corps MARS you will need a station capable of operating on military frequencies in a least two HF bands (eg. near the 40m and 80m Amateur bands). Since Navy - Marine Corps MARS handles a lot of RTTY messages you will also want to have a RTTY station capable of 100 wpm.

Bill Wells, RMC, USNR
Chief MARS Operator, Naval Reserve Readiness Command Region 20

BC-PHONES 2takes
NSA Seeking 500,000 'Secure' Telephones
Exclusive 6 p.m. EDT embargo
By DAVID BURNHAM
c.1984 N.Y. Times News Service
    WASHINGTON - The National Security Agency is proposing that the government and industry be equipped with as many as 500,000 telephones that can be secured against interception.
    The agency is convinced that the Soviet Union and the other nations are obtaining important intelligence from United States telephones.
    Although cloaked in secrecy, a program like the one the agency proposes could cost hundreds of millions of dollars. The project could also lead to a new role for the intelligence agency in private industry. Under the proposal, production of the secure phones would begin in two years.
    The decision by the largest and most secretive American intelligence organization to propose a major effort to combat telephone eavesdropping was disclosed by Walter G. Deeley, the senior official in charge of protecting government communications.
    He said in an interview that electronic eavesdropping by the Soviet Union, other countries he did not name and corporations posed a genuine threat to the security of the United States.
    ''I want the country to be aware that if we don't protect our communications, it can do a great deal of damage to us,'' Deeley said. ''This is a problem that goes to the very fabric of our society. It is not just a worry of the national security agencies.''
    He said he believed the United States was in ''deep trouble,'' adding: ''They are having us for breakfast. We're hemorrhaging. Your progeny may not enjoy the rights we do today if we don't do something.''
    A Reagan administration official familiar with intelligence matters agreed there was a surveillance problem, but he also said no final decision had been made to go beyond research or to request money to produce the phones.
    In August, the National Security Agency sent a letter to more than 2,000 major corporations saying, ''The U.S. has initiated an effort to develop low-cost, user-friendly secure telephone instruments.''
    The number of secure telephones currently used by government agencies is classified information. But the Carter administration said there were 100 such phones in the government, and it planned to

buy 150 more. The cost of each phone then was $35,000. The Reagan administration has bought an unknown number of additional secure phones.

The phones proposed by the NSA would be used by the Central Intelligence Agency, the Defense and State departments, military contractors and other private corporations such as banks that handle information of possible use to a foreign power.

The NSA was set up by President Truman in a secret executive order in 1952 to conduct electronic intelligence all over the world and protect the sensitive messages of the United States. It has used its secret budget, now estimated at $4 billion a year, to make itself a major sponsor of advanced computer research, and it has played an important covert role in shaping national communication policy. Its top officials almost never grant on-the-record interviews.

''Anyone making a phone call to the West Coast or Boston from the Washington area has no idea how the conversation will be transmitted,'' Deeley said. ''It might go via fiber optics, conventional cable, microwave towers or one of the 19 domestic satellites. If is going via satellite you can presume the other guy is listening to it.''

Asked for specific examples of electronic espionage, he said he could not disclose them because they were classified. Citing individual cases, he said, would give the Russians important clues about the ability of the United States to detect their efforts.

Deeley said his agency was developing a similar program to improve the security of computerized data. ''This area has blown up extraordinarily fast,'' he said. ''In many ways computerized data is more harmful than telephones because it's all record information.

''The financial institutions have become aware of this problem. The insurance companies are becoming aware. The rest of the private sector companies are just now beginning to see that if they are going to survive, they have to protect their communications.''

He said increasing American use of communication satellites and microwave transmission towers made it economically possible for almost any nation and many large corporations to intercept messages, then use high-speed computers to sort them out.

A spokesman for the American Telephone and Telegraph Co. said he could not estimate the amount of telephone traffic that was subject to relatively easy interception because it was transmitted by microwave towers or satellites. But he added that one rough indicator was that 70 percent of AT&T's domestic equipment and 60 percent of its overseas equipment transmitted telephone messages through the atmosphere rather than by cable, which is harder to intercept.

Few members of Congress other than members of the Senate and House intelligence committees are aware of the NSA's plan. One exception is Rep. Glenn English, D-Okla., chairman of the House Government Operations Subcommittee on Information. In a letter Sept. 24 to the General Accounting Office, a congressional investigative arm, he said, ''There can, of course, be no objection to maintaining adequate security for classified information.''

He said, however, that he knew ''from past experience that the national security bureaucracy has a tendency to require a degree of protection for classified information that may be excessive.'' He

added, ''Technological security measures are very expensive, and my concern is that the unnecessary use of these measures is a waste of scarce federal funds.''

English asked the GAO to prepare an unclassified report on whether the proposed protective measures were necessary and worth the cost.

Henry Geller, director of the National Telecommunications and Information Administration in the Carter administration and now the head of the Washington Center for Public Policy Research of Duke University, raised questions about the project.

He said that when the Carter administration studied Soviet eavesdropping, it decided that its biggest security agency should be responsible for assuring the communications security of the American military and American intelligence services but that the Commerce Department should be responsible for working with private companies.

''There was a strong belief in the Carter administration that the United States has a long and important tradition that the telephone systems and broadcasting groups are independent, privately owned entities,'' he said. ''Adopting a plan that gives the NSA, a branch of the Pentagon, an important role in the communication network of private corporations and civilian agencies of government is a significant policy change that should be carefully examined by Congress before it is adopted.''

Deeley said his agency's concern prompted it earlier this year to award five of the major American communication companies small contracts to conduct individual studies; the object would be to determine whether they could mass-produce a low-cost, easy-to-use telephone that would be difficult to intercept. The companies are AT&T, the GTE Corp., the ITT Corp., the Motorola Corp. and the RCA Corp.

Deeley did not describe the telephones, but experts in the field said each would presumably have a small computer that would transform the voice signals into a stream of coded digits. They said this would require time and expensive equipment for an outsider to decode the message.

However, after the coded message was transmitted by conventional means to another special telephone, the receiving unit's computer could quickly turn the digits back into an understandable voice.

As a result of the preliminary studies supported by his agency, Deeley said that he hoped to get bids on the project in November and sign an agreement with two of the five companies before the end of this year, and that production of the devices could begin before the end of 1986. ''We're talking about a half a million phones,'' Deeley said.

While the Carter administration paid $35,000 for each such phone, Deeley said the NSA hoped that mass production could cut the cost.

''Communications security is like insurance,'' he said. ''It has no intrinsic value until it is needed. Some people buy insurance, some don't. If you are a responsible person with a family, you take out a little term insurance. If you aren't, you buy a case of beer.''

Deeley said a major investment in secure telephones by the private sector would result in a substantial reduction of the cost of such equipment for the federal government.

''If Exxon or Hanover Trust want to protect themselves,'' he said,

''they ought to be able to get the right equipment to achieve that
goal. If they don't care about other people reading their mail,
that's their business.''

**** UoSAT Bulletin-95   5th October 1984 ****

UoSAT Spacecraft Control Centre,   University of Surrey

  ****
* UoSAT-OSCAR-9's Third Birthday *
  ****

UO-9 was launched at 11:27 gmt on 6th October 1981 from Vandenberg AFB, California into a 554 km sun-synchronous, polar earth orbit by NASA DELTA-2130.

A great deal has happened since that day, both on the spacecraft and on the ground. UO-9 took a little while to 'tame' - the difficult command links caused the commissioning phase to stretch longer than anticipated and gave rise to the well-remembered months of 'steady tone' whilst UoS and SRI fought to regain use of the spacecraft. Those months (5) were put to good use upgrading the ground station and, following the successful recovery of the spacecraft, great strides were made with the activation of the on-board experiments and particularly navigation and attitude control. The complex and difficult despin and attitude manoeuvres culminated in temporary gravity-gradient stabilisation, however the magnetometer cables on the boom became tangled during deployment and the boom had to be retracted. The spacecraft was then spin stabilised and the remaining experiments activated. A weekly schedule of daily experiments have been executed for the last two years including a weekly news Bulletin Service; CCD image data; Radiation Experiment data, computer-generated telemetry, DIGITALKER and whole-orbit telemetry surveys. The Bulletin service has been especially successful for maintaining the user community in close contact with spacecraft operations; future mission proposals and more general space news. The DIGITALKER experiment has had a profound impact in schools and colleges worldwide due to its vivid demonstration of low-cost, simple satellite groundstations. The CCD camera has not yielded the hoped-for image quality, but regular image dumps have stimulated interest in image processing and acted as a development tool for the UO-11 CCD Experiment. The best image thus far was received this week!

UoSAT-1 has not exhibited any measurable degradation since the failure of the secondary computer memory devices in the summer of 1982 and the rate of decay of the orbit has been much less pronounced than was anticipated - giving rise to an extended orbital lifetime of, perhaps, another two years?

The UoSAT Team at Surrey would like to take this opportunity to thank the many experimenters for their participation, support and patience (!) during the mission thus far and we look forward to more exciting projects.

** GENERAL NEWS **

** AMPTE-UKS Spacecraft Update **

The three Active Magnetospheric Particle Tracer Expt. (AMPTE) spacecraft launched successfully by NASA DELTA from Cape Canaveral on Thursday 16th August are reported to be functioning well. UoSAT contributed some signal processing modules to the UK satellite. Lithium releases have been successfully completed on Sept 11 and 20th and the major barium release of 10E25 ions is currently scheduled for Christmas day 1984. This release should give rise to a spectacular artificial 'comet' visible to the naked eye from the ground.

Some experiments have been scheduled with UO-11 - more later in the Bulletin.

** NOAA-9 **

The launch of NOAA-F (9) has been set for the 12th of November.

** UoSAT-Oscar-9 Schedule **

This weeks schedule is as follows:

```
Friday    -  load Bulletin
Saturday  -  Bulletin/DIGITALKER/1200 bps telemetry
Sunday    -  Bulletin/DIGITALKER/1200 bps telemetry
Monday    -  Bulletin/DIGITALKER/1200 bps telemetry
Tuesday   -  CCD Camera - next week Radiation data
Wednesday -  Whole orbit telemetry survey
Thursday  -  Computer check-summed telemetry
```

The 21 MHz Beacon will be in use this week.

* CCD Image!! *

A routine CCD image taken last Wednesday afternoon contained a close-up view of northern Italy with both coastlines quite clearly defined - the best yet! Does anyone else have hard copy of this image data? As this image was more interesting than usual, it will be repeated next Wednesday (10th) instead of Radiation data.

** UoSAT-Oscar-11 Operations **

* 9600 bps data was received successfully for the first time from the UO-11 435 MHz downlink at UoS today (Friday) - work continues!

* The real-time clock in the standard telemetry frame on UO-11 was reset to GMT (within 4 secs) on orbit 3077 (Friday 28th) to facilitate the data-logging of telemetry. The clock was reset using the spacecraft on-board computer feeding time information to the telemetry system. Sorry it has taken us so long to get around to this task!

* Particle/Wave Experiments - UO-11 and the AMPTE spacecraft will be in conjunction for a couple of weeks at the end of October allowing the simultaneous measurement of P/W interactions with UO-11 and UKS. Preliminary tests will be carried out on Monday 081084 to evaluate the P/W experiment in preparation for this experiment. These conjunctions occur only once every six months so we must get going! More details will be given soon.

* No CCD images were taken this week as work continues on preparing for the 9600 bps downlink and carrying out DCE rf tests from UoS.

* The Particle/Wave experiment channel plate control counter has been checked prior to testing of the Electron Spectrometer next week. A meeting with AMPTE experimeters from the Rutherford Appleton Labs. took place at UoS today (Friday) to discuss the operation of the P/Wave experiment on UO-11.
A daily account of UO-11 operations follows:

DAY	ORBIT	CHANNELS	RESET TIME
***	*****	********	**********
Friday	3082	1,2,3,52	18:09:55
(Telemetry rate set to 300 bps for longer survey!)

Subj: Has anyone heard MARCE?

We are trying to collect reports on the Marshall Amateur Radio Club
Experiment (MARCE) flying on the current 41G Shuttle flight (see Sept
QST, pg 46). Has anyone heard the 435.033 downlink at all? The ad hoc
net on AO-10 (145.957 downlink) has produced no confirmed signals.
The builder of MARCE, W4QAU has been on AO-10 from WA4NZD eagerly
awaiting inputs. If you have any news, forward by this channel or
join us on AO-10 between 00:00 and 01:00 UT.

GATEWAY SUBSCRIPTIONS

If  you have received the first two issues of Gateway for free,  now  is
the  time  to  subscribe.   We have to recover the  cost  of  producing,
printing,  and mailing the newsletter.   Subscription information can be
found on the back page.

GATEWAY INPUT

Is  there  packet  activity  in your area which you think  would  be  of
interest to the readers of Gateway?   If there is, send it along to ARRL
Hq,  marked "Attention: Gateway Editor."  This newsletter was started to
distribute information about packet radio throughout the world.  Send us
a  summary of activity on your packet network or tell us of any  packet-
radio related R+D work going on in your area.

HF PACKET BULLETIN BOARD
```

You can now connect to the W0RLI packet bulletin-board system (PBBS) on twenty meters. The PBBS is located near Boston, MA, and is run by Hank Oredson, W0RLI. Hank has had the PBBS on 145.01 MHz for several months, and it has become one of the major "servers" for the large Boston-area packet network.

The W0RLI PBBS software, written by Hank in Z80 assembly language, runs on a Xerox 820 with a TAPR TNC. The PBBS provides automatic time/date stamps for messages, automatically deletes inactive messages, and will even try to send you a beacon if there is mail waiting for you. Now, with the addition of a second TAPR TNC, the bulletin board is available on both HF and VHF.

On twenty meters you will find the PBBS as near 14.080 MHz as band occupation permits. Use 300 bauds, and 200-Hz shift. (The same shift and speed used by 10-MHz packet stations.) When you connect to W0RLI, the PBBS will send you operating instructions. Via W0RLI.

NTS TRAFFIC VIA PACKET

W0RLI's PBBS is also being used to originate NTS traffic. Messages are stored in standard NTS format, with the preamble information on the first line of the message. The PBBS is checked each evening and messages are then delivered to the appropriate NTS net.

Packet radio is a valuable tool for traffic handling. Of course, the national packet network that we are working toward will be a perfect traffic-handling tool, but what we already have can and should be connected to NTS. The existing local networks can be used for message origination and delivery. Two packet stations on 10 MHz or OSCAR-10 could provide TCC service. These operations could begin today if NTS officials contacted packeteers, or packeteers contacted NTS officials. Let's get started!

Via The NEPRA Packetear.

PACKET RADIO AND ARES

Among packeteers, it is "common knowledge" that packet radio would be a good mode for the high-volume, error-free communications needed during emergencies. Unfortunately, this knowledge has yet to reach the leaders and operators in the Amateur Radio Emergency Service (ARES). To remedy this, a new chapter has been added to the ARRL's Emergency Coordinator's Handbook.

In July, Mike Riley, WF4R, editor of the EC Handbook, met with Terry Fox, WB4JFI, of AMRAD. The two discussed ways in which packet radio could aid the ARES. The new ten-page "Packet Radio" chapter in the EC Handbook is the result of that discussion.

The EC Handbook is sent free-of-charge to all Emergency Coordinators.

The latest edition, with the packet-radio chapter, will be available early in September. At that time, packet-radio enthusiasts should be prepared to discuss emergency operations with their ECs.

HIGH-SPEED PACKETS

On August 23, Curtis Spangler, N6ECT, and Mike Flynn, W2FRT, exchanged packets at 9600 bauds using quadrature amplitude modulation (QAM) techniques. Both stations were using personal computers, 9600-bit/s modems, homemade radio/modem interfaces, and 440-MHz radios. Special software, written in Turbo Pascal, drove the synchronous data link controller (SDLC) cards in the computers. Over the five-mile path between the stations, there were no errors using 10 watts, and 60% to 70% throughput at one watt. Via KA6M

TELEPORT STA

On August 6, the ARRL and AMSAT filed a request for special temporary authority for the operation of teleport stations. The following comes from the text of the STA:

"The operations of the stations operating under the STA will involve communications with terrestrial Amateur Radio Stations and Amateur Radio stations in space operation. They will function primarily as intermediary stations between terrestrial and space Amateur Radio stations. We hereby designate these intermediary stations `teleports.'

"The purpose of a teleport is to relay digital messages automatically between terrestrial Amateur Radio stations and amateur stations in space operation (amateur satellites). This need to do so is twofold:

"(1) to obviate the need for every Amateur Radio station having a digital communications capability to also have an earth station capability in order to communicate with amateur satellites.

"(2) to provide a measure of traffic-flow control for the digital channel(s) on the satellite(s)...

"There are three primary objectives of this request for STA:

"(1) to determine experimentally what equipment and techniques are required to provide near-real-time relays between two or more terrestrial stations using local teleports and an amateur satellite.

"(2) to determine experimentally what is required to provide reliable store-and-forward communications wherein the teleport station buffer stores the messages between the hours that the satellite and terrestrial links are not available at the same time.

"(3) to gather the necessary information for permanent rule change to permit teleport operation."

The request for STA then goes on to list the frequencies of operation, and other administrative details. The following stations will be authorized to operate teleports when the STA is approved: John Biro, K1KSY; Tom Clark, W3IWI; Den Connors, KD2S; Bob Diersing, N5AHD; John DuBois, W1HDX; David Engle, KE6ZE; Gary Garriott, WA9FMQ; Sumner Hansen, WB6YMH; Lyle Johnson, WA7GXD; Phil Karn, KA9Q; Bob McCaffrey, K0CY; Harold Price, NK6K; Bill Reed, WD0ETZ; Hank Magnuski, KA6M; Vern Riportella, WA2LQQ; Jose Sancho-Dominguez, WB5YFU; Bob Stricklin, N5BRG; ARRL club station, W1AW; and AMRAD club station, WD4IWG. Building a teleport is a demanding task, and no one will have a teleport immediately. Please do not bother these operators by asking when their teleport will be on the air.

OSCAR-10 and UoSAT-OSCAR-11 are the satellites that are likely to be used by the authorized stations. OSCAR-10, with its long access times and great coverage, will be used to test the near-real-time links. UoSAT-OSCAR-11, if it is made available at all, will be used for store-and-forward teleports.

Watch Gateway for further news of the STA and the stations involved.

PACKETEERS ARE EVERYWHERE

There is a lot more packet activity out there than meets the eye! This was brought home to me on a recent weekend while my wife Linda, KA1ZD, daughter Deryn, and I were vacationing in New Hampshire. As we were wandering around a computer tent sale, someone spotted Linda's HT and said, "I bet you're a ham." He turned out to be Dave McLanahan, WA1FHB, and we had a long and pleasant conversation about all sorts of things. Eventually I introduced the subject of packet radio, and asked innocently if Dave was familiar with the mode. He was not only familiar with packet, he was on it! Living in a bit of an RF hole in the wilds of southwestern New Hampshire, Dave goes hilltopping with a ZX81, a 5-inch TV monitor, and a GLB TNC to connect into the Nashua, New Hampshire area. With EASTNET growing as it is, he should soon be able to packet without leaving his home. Via Dave Sumner, K1ZZ.

[Dave is General Manager of the ARRL -- Ed.]

PACKET RADIO IN AUSTRALIA

There are at least two active packet clubs in Australia, one in Melbourne and one in Sydney. The newly-formed Melbourne Packet Radio Group has four members: John Smelstorius, VK3ZVR; Ian Clark, VK3YRR; Peter Jetson, VK3ZMB; and David Furst, VK3YDF. These four have started a local net using the VADCG protocol. They will be attempting to link to the larger group in Sydney.

The Sydney Amateur Digital Communications Group (SADCG) has an active net of about twenty stations with a digipeater and a packet bulletin-board system.

Perhaps someone will set up an HF or satellite gateway linking the U.S. and Australia.

Via Amateur Radio.

THE PACKET ADAPTIVE MODEM

If amateurs are to construct a long-distance packet network in the near future, some of the cross-country links are going to have to be on HF. While HF links are not as reliable as VHF links, we simply cannot expect to have a complete chain of VHF sites across the country as soon as we need it. The HF links will have problems not encountered on VHF links, such as long-term fading and multipath effects. To combat these problems, Bob Watson, and Paul Rinaldo, W4RI, designed the Packet Adaptive Modem (PAM).

Briefly, PAM uses a 600-Hz shift at 75, 150, 300, 600, or 1200 bauds. Programmable switched-capacitor filters (like those used on the TAPR TNC) keep the modem passband as narrow as possible, reducing noise and QRM on the received signal. In operation, the stations using PAM can determine the highest data rate that the link can support, and then use that data rate. If the link gets worse, they can go slower. If the link gets better, they can adapt and go faster. This should allow the use of the best transmission rate for a given link. [For further discussion of PAM, see Second ARRL Amateur Radio Computer Networking Conference proceedings, published by the ARRL.]

PAM is built on an S-100 card, but only uses the S-100 power supply. Serial I/O and filter control lines are provided through an RS-232-C port.

Jon Bloom, KE3Z, has built two PAMs in the ARRL lab. One of these "alpha test" modems will be sent to Ralph Wallio, W0RPK, and the other will be set up at W1AW. Testing of the modems will then be conducted on several HF bands.

After these units are tested, the circuit board layout will be updated and several "beta test" modems will be made available for more widespread testing.

RMPRA PACKET BULLETIN BOARD

The Rocky Mountain Packet Radio Association (RMPRA) is now operating what they believe to be the most sophisticated packet bulletin board around.

The system is a modified version of The Bread Board System (TBBS), by Phil Becker, WB0EIV. It was donated to RMPRA and modified for packet-radio operation by Phil and Dave Ebert, W7RH.

TBBS is a modular software system that can be easily modified by the

system operator to fit his particular needs. The RMPRA version is accessable through the Pike's Peak digipeater or via telephone at (303)-452-4735. If you want to call up and see the software in operation, set your terminal to 300 bauds, half duplex, 8 data bits and no parity.

23-CM BAND PLANS AND PACKET RADIO

Although most packet-radio activity is now on the two-meter band, band plans for the higher VHF and UHF bands will have profound effects on the future of packet radio. The number of packet stations on the air increases daily, and the need for high-speed, wideband links is becoming obvious in many urban areas. Both of these factors will push packet radio onto the higher bands, where several hundred kiloHertz of band space should be easy to come by.

Since it is important for packet-radio enthusiasts to keep track of VHF/UHF spectrum plans, we present here a proposed band plan for the 23 cm band.

The ARRL VHF UHF Advisory Committee will recommend a 23 cm bandplan to the ARRL Board of Directors at the B.O.D.'s October meeting. The latest draft of this recommendation contains the following allocations of interest to packet-radio operators:

1240 MHz - 1258 MHz	Wideband communications
1258 MHz - 1260 MHz	Medium bandwidth digital duplex (with 1288-1290).
1275.5 MHz - 1276 MHz	Single-frequency digital communications.
1276 MHz - 1288 MHz	Wideband communications.
1288 MHz - 1290 MHz	Medium-bandwidth digital duplex (with 1258 - 1260).
1297 MHz - 1300 MHz	Single-frequency communications, eg. digital, control links, cross-mode and remote base.

"Wideband communications" includes ATV, spread spectrum, and digital. Those portions of the band allocated to wideband communications will be coordinated by region. It is further recommended that coordination of multiple users of a single channel in local areas can be achieved through isolation by means of cross polarization and directional beam antennas.

It should be remembered that the above is a draft of a recommendation that will be presented to the ARRL Board of Directors. It is not a currently adopted bandplan.

It is important that packet-radio enthusiasts keep in touch with representatives of their local and national frequency-coordination

groups so that packet radio's future will be provided for. The ARRL Board of Director's meeting will be in October, so be sure to express your feelings on the 23-cm bandplan to your Director.

CLUB LISTING CORRECTIONS, ADDITIONS

Add to the listing of packet-radio clubs:

Oahu Packet Enthusiasts Club (OPEC)
P.O. Box 1355
Pearl City, HI 96782

Pacific Packet Radio Society (PPRS)
c/o Hank Magnuski, KA6M
311 Stanford Avenue
Menlo Park, CA 94025

Colorado Springs, CO 80918

TAPR GETS OFFICE

Tucson Amateur Packet Radio (TAPR), an international Amateur packet radio research and development group based in Tucson, Arizona, is proud to announce the opening of its office.

The office address is:

TAPR
1016 East Pennsylvania Avenue
Suite 302
Tucson, AZ 85714
Phone: (602) 746-1166
Office hours are 9:00 AM - 5:30 PM (MST) Monday through Friday.

The office staff is provided to expedite information requests, provide spare parts support, fill orders, etc. They can NOT answer technical questions. Technical questions should be routed to the TAPR P.O. box (printed in the last issue of Gateway).

AEA PACKET RADIO INFORMATION

John Gates, N7BTI, of Advanced Electronic Applications is willing to talk on the phone or correspond by mail to answer technical questions concerning packet radio.

Contact: AEA
P.O. Box C2160
Bldg O&P 2006-196th SW
Lynnwood, WA 98036-0918

PACKET RADIO AT HAMFESTS

Several Buffalo, NY, ham radio clubs will be sponsoring the HAM-O-RAMA at the Erie County Fairgrounds on September 7 and 8. This hamfest is of intrest to packeteers, since the swap meet will feature computer equipment and the presentations will address "Computers and Amateur Radio." Jeff Ward of the ARRL will give an introduction to digital communications at 9:30 Saturday morning, and Gil Bolke, of GLB Electronics, will discuss packet radio later on Saturday.

From: William G. Martin <WMartin@SIMTEL20.ARPA>

I've used a Sony ICF-2001 for many years now; I wrote the review of it that
appeared in Review of International Broadcasting. (I had that archived
but retrievable until we changed hosts earlier this year; sorry I can't
just send out a copy now.) I plan on doing a direct comparison between the

two Sony models (ICF-2001 and ICF-7600D [same as the 2002]) and the Uniden when I get the latter. I'll send that info out on the list.

It's sad that it is just about impossible to do any comparisons or evaluations of shortwave portables in stores. They always seem to be in steel-framed buildings and loaded with fluorescent lights, and they never have an external longwire you can attach to for testing.

I can point anybody interested in these receivers to the latest (1984) issue of the World Radio TV Handbook -- if you can't find that in a radio store, your local public library may well have a copy. The back section includes some extensive receiver reviews by Larry Magne, and that issue covers the field which includes the Uniden, Radio Shack, and Sony (with a pointer to the preceeding issue with the 2001 review).

I can give a subjective impression of comparing some of these with my "big" radio -- a Galaxy R-530 (this was made by Hy-Gain and was one of the better non-digital direct-frequency-readout solid-state models, using accurate dial calibration instead of a digital display; it does suffer from excessive cross-modulation, so it's not wonderful, but it was fairly well regarded when it came out).

With the same external antenna connected, everything is sensitive enough that it is hard to tell the difference. Without external antennae, using just the whip (of course the Galaxy doesn't have one), the two Sonys have definite differences. The 2001 is MUCH more sensitive than the 2002/7600D. A lot of this is simply due to the newer model's smaller size -- they can only install a whip half the length of the one on the bigger version; there is only so much room for the telescoped whip to fit into. The Uniden's whip is about as long as the 2001's, and reviews indicate that it has similar sensitivity.

As far as selectivity goes, it is sort of meaningless to compare a communications receiver with switchable filter banks with an entertainment portable. I never did get all the possible filters installed in the Galaxy anyway; at $65 each or so, it wasn't worth it. The 2002/7600D has much better selectivity than the 2001. The 2001 has a single, rather wide bandwidth for AM, and the narrow bandwidth filter only operates while in SSB/CW mode. In the 2002/7600D, the main filter is much improved, with better shape factor, and the narrow filter can be switched in without turning on the BFO (or product detector or whatever it is). However, most models of the 2002/7600D exhibit a "pulling" characteristic when receiving SSB or CW, which means the receiver tends to tune toward strong signals nearby, which can make reception of a weaker SSB signal close to a stronger one just about impossible.

The Uniden, though modelled after the 2001's circuitry, has improved filter characteristics, and has bandwidth switchable independent of the SSB/CW mode choice. None of the reviews have mentioned any "pulling" problems with it similar to the 2002/7600D in SSB, so therefore I think it may be the best choice for a ham backup, in addition to the price factor.

Hope all this is of help in making your decision.

Regards, Will Martin

The FM detector option allows my R70 to detect NBFM
signals within the 100 KHz - 30 MHz range. I use the
FM detector mainly for cordless phone listening,
although I used it initially for monitoring 10 meter FM
activity. The FM detector would be useful if
a VHF
converter were placed ahead of the R70.

From reading the R70 instruction manual, it appears
that this receiver can be connected to an optional ICOM
VHF converter in such a way as to permit direct fre-
quency readout using the display section of the R70. I
haven't yet seen any ICOM converters offered for sale
in the US. Maybe European netnews readers can add some
insight here.

Yes, the 1947 vintage SX-42 was a hefty toy!
I too
wish Hallicrafters had seen fit to permit all band FM
reception.

A friend of mine has put together his TAPR packet board but has found that
the function of the switches on the front of the box are not documented.
Can someone explain them please? He's particularly curious about the Bank 0/1
switch and also how (or if) these switches interact in any way with the DIP
switches on the board.

x
  I just purchased a new Kenwood TR-2600A 2 meter walkie-
  talkie (it was a tossup between it and the ICOM IC02AT).
  Like the other brand new Kenwood vhf/uhf radios, it comes
  equipped with   DCS, a Kenwood-ized ASCII afsk digital squelch
  system, which   allows what is   essentially "selective
      call"
  operation.

  Since this is a new "feature", and few hams I know have
  equipment containing this circuitry,   I haven't found
     anyone

to test it with yet! Has anyone in net-land tried using this new digital signaling feature Kenwood-to-Kenwood? Comments?

Anyone else have a TR-2600A? So far, it has performed quite well, especially the 140 -160 MHz receive coverage.

I will post a product review after I have more experience with this radio.

Owner's Report: Kenwood TR-2600A 2m Walkie-Talkie, a Winner

In considering the purchase of a new 2 meter ht, I limited my choices to the Kenwood TR-2600A, the ICOM IC02AT, and the Yaesu FT209, the Yaesu not being available for another few weeks. I bought a Kenwood TR-2600A, a 2.5w/300mw, 10 channel ht, and have been using it now for one week.

There are at least 4 features that separate this unit from other new 2m ht's:

1. As sold off the shelf, this ht has continuous receive coverage

from 140 - 160 MHz. Factory authorized modification information that permits out of band transmitter coverage will be furnished upon receipt of a copy of the owner's MARS license.

2. Like other new Kenwood vhf/uhf offerings, a Kenwood designed digital control squelch (DCS) is included. To quote from the owner's manual:

"The new DCS system gives the operator the ability to select which stations he wants to listen to. Only those stations that transmit the proper data will be able to "open" the squelch of the TR-2600A, when the DCS system is actuated."

"A short burst of ASCII data, at the beginning and end of the transmission, contains the necessary information for the proper DCS system operation. Both a 5 digit access code and call sign data are contained in this data string."

3. Using the keypad, the owner's call sign may be programmed in ASCII. An optional rolling screen type LCD display accessory can display the call sign of the transmitting station, and store call signs of those others that have called (crude form of mail box).

4. In a throwback to the early ht's from Standard and Wilson, a conventional, but illuminated, meter is located on the top of the radio. It is used as an S-meter on receive, and a battery voltmeter on transmit. The Yaesu FT209 has a conventional meter also. The ICOM IC02AT uses a section of the LCD display as a bar graph.

The TR-2600A allows one to scan the 10 memory channels, scan between the limits in channels 8 and 9, or scan the entire 20 MHz wide band. In the last two modes, the user can select the frequency increment (e.g. 5, 10, 15, 30 KHz etc). Unlike the ICOM IC02AT, individual channels may be locked out (excluded) from the memory scan.

Like the IC02AT and FT209, plus 600, minus 600, and simplex offset information is stored with each memory channel. Odd splits can be programmed by selecting channel 0 as the transmit frequency. A latching type "reverse" switch is included.

I bought the optional $35 CTCSS ("PL" - tm) encode-only deck. As in the earlier model TR-3500 UHF radio, this deck fits inside the radio, and the proper CTCSS frequency is selected by programming the 6 DIP

switches, which protrude through the rear of the case. The ICOM IC02AT comes with PL as a freebie. The PL code is programmed into memory from its keypad.

The TR-2600A comes standard with a 450 mah NiCd battery and 15 hour wall charger. The ICOM portables come with a short life 225 mah battery. I bought a spare battery and the ST-2 rapid charger/base power supply. My ST-2 recharges a completely dead NiCd pack in 1.0 hours.

Using a Fluke 8024B DMM and Bird 43 wattmeter, I checked out the current drain of my TR-2600A. The figures in parenthesis are Kenwood's specifications:

condition	voltage	current in ma.
recv, fully squelched	8.4	36 (35)
recv, open squelch, volume off COR LED glowing	8.4	61
recv, open squelch, full volume	8.4	135
xmit, high power, pl off	fresh battery	644 (less than 800)
xmit, high power, pl on	fresh battery	660
xmit, low power, pl off	fresh battery	264 (less than 400)
xmit, low power, pl on	fresh battery	268

The power output into a Heath "Cantenna" measured 350 mw on low power and varied between 2.5 and 3.5 watts, depending on the frequency.

The standard battery seems to last a good long time.

With the exception of the Tempo S5 and S1, low audio output in the receiver section has plagued several ht's (e.g. ICOM 2AT, 02AT, Yaesu FT208R). In contrast, the audio output on the TR-2600A is husky. I have no problem hearing stations in crowds when the radio is worn on my hip. I use the optional speaker/microphone on my lapel to avoid being a "walking PA system."

ICOM has a good reputation for compatibility of accessories across its product line. Kenwood dealt the owners of the predecessor TR-2500 and TR-3500 a bad hand: the batteries, speaker/mic, and leather case are not upwards compatible with the TR-2600A. However, the rapid/charger is the same for all units, and with the exception of a label, the CTCSS deck is the same for the TR-2600A and TR-3500.

Aside from an error in the DCS section, the TR-2600A users' manual reasonably well written, containing a block diagram and schematic. No PC board layouts are included, but a service manual will be available for purchase. The users' manual makes reference to the TR-3600A, which I assume will be the (as yet unannounced) 440 MHz version of this radio.

Some other user impressions:

- The ability to selectively lock out memory channels from the memory scan is a big win over the ICOM IC02AT. I wish both of them would scan faster though.

- I have no way to test the ASCII and DCS fanciness. I would have preferred a convention PL be included as standard instead. The circuitry for this new Kenwood feature is implemented using a separate microprocessor and modem chip, so it wasn't just a free-bie. If the Kenwood idea doesn't become widely accepted, this feature will be useless.

- The keyboard has a nice, positive feel (differs from TR-2500).

- The belt clip was $5, and it should have been standard.

- The keypad is also a 16 key DTMF pad and one hears the tones as the keys are struck. The xmtr is held on for 2 seconds after each key is struck (a nice touch).

- The supplied BNC-terminated flexible antenna looks more like a 450 MHz "rat tail", but it seems to work about the same as the more familiar, fatter heliflex.

- The plastic case doesn't seem as rugged the ICOM cases do. There wasn't as much weatherproofing either.

In summary, I enjoy using this radio. A hand held radio that scans the public service/business/government frequencies AND allows amateur QSOs seems twice the fun of a conventional ht or pocket scanner.

I'm awaiting announcement of the UHF version, in hopes that it too provides generous out of band receive coverage.

Hams are allocated 2300-2450 mhz. The MDS channels are adjacent to this band and most of the pirate equipment is modified from HAM kits. Sidesteping the legal issue of the actual receiving of the MDS signals, should HAMs suffer (by harrasment or restricting equipment availability) because there MIGHT be unauthorized reception taking place. (I intentionally said unauthorized as opposed to illegal because it is STILL undetermined!!!)

As for the individual who sent me mail about what information should or should not be posted, the mail went into the bit-bucket. Until the courts decide otherwise, if it comes through the air into my airspace, I feel that I can look at it for personal use.

Mikey KA5MJQ

From: VRIP
To: AMSAT
Subj: AO-10 Interim Operating Schedule

An AO-10 interim operating schedule was put in effect on 03 Sep 84 by DJ4ZC.
The following was compiled based on a report by VE1SAT.

Interim Operating Schedule:

MA Start	MA End	Mode
190	031	Off
032	099	B
100	116	L
117	189	B

Mode B replaces Mode L on Sundays. (B continuous 032-189, inclusive)

Beacon Schedule:

Mode B		Mode L	
Minutes Past Hour	Beacon Mode	Minutes Past Hour	Beacon Mode
00-04	CW	00-04	RTTY
05-14	PSK	05-14	PSK
15-19	RTTY	15-19	RTTY
20-29	PSK	20-29	PSK
30-34	CW	30-34	RTTY
35-44	PSK	35-44	PSK
45-49	RTTY	45-49	RTTY
50-59	PSK	50-59	PSK

It is suggested that, based on post-eclipse analysis, it may be possible to

expand the transponder operating schedule beyond that described above. The health of the spacecraft (batteries in particular) shall be the determining factor. The current perigee eclipse period commences now and lasts until mid-October. The eclipses reach maximum duration on/about 21 Sep when the duration will reach 1.16 hours +/-. DJ4ZC says a further schedule adjustment will be made in October (presumably) at the completion of the eclipse season.

CW is at 13 wpm; RTTY is 170 Hz 50 baud FSK Baudot; PSK is 400 baud ASCII.

qst de k9eui
hr arrl bulletin nr 65 from arrl headquarters
newington ct august 28, 1984
to all radio amateurs bt

rm 4831, the sti petition to take 216 to 222 mhz for private land mobile, has been put on hold by the fcc. two companies with interests in the inland waterway communications system, acbl and watercom, obtained an extension of the deadline for filing comments until 14 days after an fcc administrative law judge rules on their petition claiming a conflict of interest. the petition seeks to disqualify stis law firm because it had previously represented acbl and watercom. in the meantime, amateurs can and should continue to file comments in this proceeding. when a new deadline is known, w1aw will carry this information. comment and reply deadlines in rm 4829, the lmcc petition, are not affected by this action. please be aware that copies of comments on such petitions must be served on the petitioner. it is adequate to send a copy by first class mail, and to attach a certificate of service to the comments. it should say something like, i certify that i have on this date sent a copy of these comments by first class mail to . . . the address for the petitioner of rm 4831 is sideband technology,

london ont august 28, 1984
to all radio amateurs bt

the crrl executive committee met on august 26 to examine nominating
petitions filed by members for crrl regional directors for 2 year
terms of office beginning january 1, 1985. the following were
unopposed and declared elected without balloting.

western region director william kremer, ve7csd
quebec region director albert daemen, ve2ij

ballots were ordered mailed on october 1 to full members in three
regions. candidates are as follows.

prairies region
   anderson, ve4ap
   gillespie, ve6abc
   gowron, ve4ads

ontario region
   loucks, ve3ar
   perrin, ve3fn

atlantic region
   hesler, ve1sh
   mclellan, ve1asj

ballots must be received by noon november 20 and will be counted
later that day. results will be announced soon after. ar

qst de k9eui
hr propagation forecast bulletin nr 36 from arrl headquarters
newington ct september 3, 1984
to all radio amateurs bt

the solar flux average for august was 83.7, the lowest monthly figure since july 1977, when the current solar cycle was just one year old. the flux has been rising slowly since its low of 74 during the third week of august. it appeared to level off at 92 in the first two days of september, but it may move a bit higher before falling again toward the end of the forecast week.

after nearly a week of minor geomagnetic disturbances and fair to poor propagation, conditions will improve september 3 and 4. another disturbance is likely september 5 and 6. somewhat more stable propagation is expected september 7 to 10.

signs of rising muf are showing, as a result of the more favorable sun position for the northern hemisphere. the 21 mhz band is becoming marginally usefull, mostly on low latitude circuits. more improved 21 mhz coverage will come later in the month. the 28 mhz band should be opening at least briefly by the middle of september, on days when the k index is 2 or lower and the solar flux is above 80. both bands will improve over the next ten weeks, peaking in november. skip will be longer, especially on 40 and 80 meters, than we have seen over the last five years.

american sunspot numbers for august 23 to 29 were between 13 and 49 with a mean of 36.3 ar

Subject: Useful mods for the Kenwood 930
Message-ID: <12036@mgweed.UUCP>
Date: Thu, 6-Sep-84 10:42:14 EDT
Article-I.D.: mgweed.12036

Posted: Thu Sep 6 10:42:14 1984
Date-Received: Sun, 16-Sep-84 12:02:12 EDT
Organization: AT&T Consumer Products - Montgomery Illinois
Lines: 144

The following is a list of favorite changes that can be made to the Kenwood 930. These changes are quite simple and do not require the addition of any switches.

NOTE: In the operator's manual supplied with the 930, there is an error on one of the drawings. On the upper left corner of the DIGITAL UNIT schematic locate connector 8. The lead designations are as follows (note that some of the designations do not appear on this sheet so you can add them to the drawing):

Pin	Desig.
1	100
2	MU
3	SCN
4	M2
5	MIN
6	FSK
7	B2
8	FT

On the main drawing, called SCHEMATIC DIAGRAM, the pin numbers shown on connector 8 are reversed from the way they are numbered on the DIGITAL UNIT schematic. In the following changes, I am assuming that the numbering on the DIGITAL UNIT sheet is correct. In any event, it will be obvious which end is which since the end pin is vacant.

CHANGES

1) The resolution of the main tuning digital readout can be increased from 100 Hz to 10 Hz. No digits are lost since the readout has the extra digit for this purpose. This change is accomplished by grounding pin 1 of connector 8 on the DIGITAL UNIT.

2) The tuning rate is 10 kHz per revolution of the main tuning knob. The tuning rate can be changed to 5 kHz per revolution by cutting one end of diode D-13 on the DIGITAL UNIT.

(Note that the black marks on the tuning knob itself are exactly 500 Hz apart. The knob can be "corrected" by tuning in an exact frequency, for example 10,000.00 kHz, pressing the DIAL LOCK switch, then turning the knob to line up a black line. As long as you don't spin the dial too fast, it will track nicely from one end to the other. With the slow rate modification, the dial increments become 250 Hz per division).

You may desire to switch this reduced tuning rate on and off. For example, you can select the new rate on just VFO B by using an unused section of the "FUNCTION" switch. Another possibility is to use the

display "DIM" switch.

3) There are an additional 8 memories available. These can be obtained by grounding pin 5 of connector 7 on the DIGITAL UNIT. (This lead is designated "M3").

The 8 additional memories can be selected by using an unused contact on the "FUNCTION" switch.

4) Each group of 8 memories can be scanned at a rate of about 1 per second. Unlike a normal scanner, The unit will not stop scanning when a signal is present, but it is a good way to search favorite frequencies for activity.

A method of turning on the scan function without affecting normal switch functions would be to wire the unused section of the DIAL LOCK switch in series with the unused section of the METER switch (meter switch in the "VC" position).

5) A handy option is to be able to momentarily unlock one VFO when the DIAL LOCK is on. This can be useful during split frequency operation when you want to keep the receive vfo locked (the DX station's xmit freq), yet quickly qsy to the frequency he is listening to with your transmit VFO.

This change can be made by wiring one lead from the DIAL LOCK switch in series with extra normally closed contacts of the "T-F" switch.

6) This change permits automatic disabling of a linear amplifier during full break-in cw operation. This is desirable since the relays in a linear cannot properly follow each keyed character element. This change should also be done if AMTOR operation is contemplated.

Assuming that your 930 has the aux. relay board in it, merely wire the +28 volt lead to the relay coil in series with the extra contacts of the "FULL-SEMI" switch.

7) For AMTOR operation, the T-R switching speed must be increased.

2 suggested changes are to remove C-500 (4.7uf) on the SIGNAL BOARD (located top center near connector 30), and to ground the junction of R-476 / Q-100.

8) In early units, the WARC band transmit was not enabled. If this is the case, solder a jumper from pin 12 of IC-23 to ground on the DIGITAL UNIT. (Ground can be obtained at pin 8 of IC-24).

9) Transmit can be enabled on all frequencies between 1.5 and 30 MHz for MARS and transverter use by adding two jumpers on the DIGITAL UNIT:

Connect pin 9 of IC-11 to pin 12 of IC-21.
Connect pin 9 of IC-12 to pin 12 of IC-22.

==========
Additional comments:

Even though the receiver low frequency end is spec'd as 150 kHZ, it will operate down to 100 kHz. [A[BTo conveniently switch in a general purpose receiving antenna you must use the transverter connector. When the 8 pin DIN plug is plugged into this connector, a switch operates which separates the coaxial antenna input from the receiver input. These two connections appear at pins 8 and 5 resp. of the transverter connector. (This 8 pin DIN plug is not furnished with the 930). The most convenient setup is to bring cables from both the REMOTE and TRANSVERTER connectors into a junction box which has appropriate connectors and switches on it for interfacing to a transverter, receiving antenna, linear amp, etc.

Here is a chart of the connections to these connectors:

REMOTE (7 pin DIN)	XVERTER (8 pin DIN)
1 Speaker output	1 Grd
2 Grd	2 +V out on xmit*
3 PTT	3 Grd
4 Q-22 out**	4 XVRT ON/OFF Control***
5 unused	5 Receiver input
6 ALC input	6 XVRTR ALC input
7 XMIT RELAY**	7 Xmit RF to xvrtr input
	8 HF ant in

* A 12 volt, 50ma max. relay may be connected from pin 2 to ground. This relay will operate on xmit.

** Original units used Q-22 collector for linear amp relay control. This did not work with low voltage relay systems or those using a negative voltage. An optional relay board (Now supplied in all units as standard) is available and provides a normally open contact closure to ground at pin 7.

*** Pin 4 is grounded to enable xvrtr operation. This may be done by a switch in the transverter itself.

According to a 1984 pamphlet entitled "Summary of State Laws Regarding Ownership and Use of Scanner Radios", by the Scanner Association of North America, "FCC licensed Amateur Radio operators with Technician Class or higher grade license" are exempt from this New Jersey law.

This was not the case at the time I fled New Jersey.

The cordless phones that I have experienced were FM only in the VHF low band (49 Mhz). The 1600-1800 link were all AM. The new phones that are advertised as all FM use new frequencies recently allocated at 49 Mhz to get FM both ways. BTW, the phones that used 1600-1800 were carrier current AM for the base to handset and FM VHF for handset to base.

Subject: Which White House circuits have been secured ?
Message-ID: <145@x.UUCP>
Date: Fri, 7-Sep-84 19:51:46 EDT
Article-I.D.: x.145
Posted: Fri Sep 7 19:51:46 1984

Lines: 77

As a follow on to the discussion of the White House use of DVP or some related digital security technique on secret service voice channels, does anybody happen to know whether they have also secured the telephone ("phone patch") circuits to Air Force 1 that have been traditionally left in the clear ? A list of those circuits in use a few years ago follows :

(note that all of this information has been published in some form)

1. "Nationwide" or "Echo-Foxtrot" half-duplex single channel nbfm voice via about 100 sites located on AT&T microwave relay towers throughout US tied by leased voice channels to manual switchboard at White House ("Crown Control"). Uses 415.700 mhz from AF-1, 407.85 mhz. to AF-1, at rather low EIRP's (less than a few watts).

2. "Combat Ciders" or "Autovon" or "Wideband" full-duplex FDM multi channel wbfm via nuclear hardened antenna's at many of the Autovon switching centers, also via relay aircraft and the various emergency command post aircraft (eg "Lookinglass"). Has provisions for secure voice and teletype (also fax) as well as fully automatic autovon voice trunks with standard autovon signalling and control. Trunks are located on 12, 16, 20 and 24 khz ssb channels, 0-4 khz is used for an order wire to ground station. Uses various frequencies in the 225-400 mhz military UHF band, 390.55 and 392.55 have been used as transmit from AF-1 in past. EIRP is (or was) very high, one published description of system said it was 1 Kw to counter absorption effects near nuclear fireballs.

3. "Yankee Zulu" full-duplex single channel nbfm voice via portable equipment set up by secret service at site of presidential visit. This system has also been used for non-secure circuits to presidential automobiles, and is probably what Reagan used to talk to the gunman in

the golf coarse incident. Frequencies are around 163 and 172 Mhz
at EIRP's of perhaps 25-100 watts.

4. "Mystic Star" hf ssb via about 10-15 AF bases throughout world with remote transceivers controlled via telephone voice channels from Andrews AFB. This system is used for telephone traffic mostly when AF-1 is out of range of the UHF links, but at least two ssb voice frequencies (and a full duplex 75 baud secure teletype channel called "India Oscar" which use a special anti-multipath modem) are maintained continuously and used for coordination of other communications links. Frequencies are chosen from a list of about 150 scattered throughout the available chunks of hf spectrum and are designated by "fox" code numbers which change from time to time.

5. Fltsatcom. A full-duplex nbfm voice channel to AF-1 is maintained via whichever of the Navy fltsatcom spacecraft are in an optimal position. This circuit (which isn't very private since 1/3 of the globe can pick it up) is mostly used for secure voice and fax transmission via conventional vf modems, but is occasionally used for clear voice traffic. (AF-1 also uses other secure forms of satellite transmission as well). Frequencies for downlink are around 261 mhz and 291 mhz for the uplink. Uplink EIRP is several hundred watts.

Are these circuits still in use ?

Does anyone know of any other non-secure AF-1 telephone circuits that they feel at liberty to discuss. ?

Finally has anyone thought that perhaps the White House decision to encrypt presidential protection communications with DES (?) implies that we consider DES breakable by world class cryptologic establishments ? One suspects that we haven't left those communications in the clear by accident as the status and health of the president of great concern to both our allies and our principle adversary. Perhaps we are assuming that the various world equivalents of the NSA can monitor presidential protection if they want to but terrorists and nosey journalists cannot ? Can anyone comment ?

According to the IC-02AT spec sheet the current drain on transmit (high power) is 1.2 Amps, while in receive with no signal present (squelched) the drain is spec'd at either 35 ma or 45 ma depending on which printing of the spec sheet you have in your hand. The Icom repair center here in Dallas says that the ones they have checked draw right at 35 ma. I recently (8/31/84) purchased a new Yaesu FT-209RH which I believe is superior to both the IC-02AT and the Kenwood TR-2600A. For the same high power output (5.0 watts) the Yaesu draws about 1.0 Amps -- 200 ma. better than the Icom (the Kenwood only runs 2.5 to 3.0 watts). On receive the Yaesu draws about 40 ma. squelched but has a battery saver circuit that can be used to reduce the average receive current drain to as low as 11 ma. This is a feature that neither the Icom or Kenwood HT's incorporate. Yaesu actually makes 2 versions of this HT -- the FT-209RH, 500 mw/5.0 watts, and the FT-209R, 350 mw/3.5 watts. The primary difference between the two radios is the battery pack itself, although each also uses a different transistor in the P.A. The battery pack supplied with the FT-209RH is a 12 volt, 500 mah pack, while the FT-209R comes with a 10.8 volt, 425 mah pack. By the way, don't confuse the '209' with the FT-203R which is a plain jane, thumbwheel switch radio designed to compete with the old IC-2AT variety radios. The FT-209R/RH is the replacement for the FT-208R which has been around for nearly 3 years. Yaesu has promised to have both 220 MHz and 440 MHz versions of these radios (209/203) so keep that in mind as well. Also, the 209/203 series radios share common accesories, i.e., batteries, speaker/mike, drop-in quick charger, etc., although the only accessory from the old 208/708 line that can be used with the new radios is the PA-3 mobile adapter/charger. I guess that's enough for now. As I use the FT-209RH and become more familiar with its capabilities I'll post the information on the net for all to see.

The manual for my ICOM R71 receiver (a truly fine piece of gear!)
shows the frequency coverage as 0.1 MHz to 30 MHz. Underneath that
it has "Australian version: 2.0MHz to 30.0MHz" and "German
version 0.15MHz to 26.1MHz". Are these coutries protecting their
own SW receiver industry or don't they want the population to
listen to some magic segment of spectrum?

-Tom Kloos, WA7NJK, Tektronix, Wilsonville, Oregon

Listen to hurricane hunter aircraft when there is an active storm
on 6673 kHz USB. These planes (WC-130) stay aloft for several hours
making up to one "penetration" of the eye every half hour. They transmit
information about the conditions near and in the eye (temp, bar. press,
condition of wall, wind speed, location, etc.).

For general coverage listening, I use a "T" network tuner on my 30
foot vertical wire (wire runs direct to the rcvr, not thru coax).

For a tuner for random wires a simple T or L network will work fine,
such as the low-cost MFJ units. It won't matter to the rcvr if it
sees 50 or 100 ohms, but if the antenna is up around 500 to several
kilohms, which it will be at some frequencies, the tuner will make
quite a difference. This is especially true of the newer rcvrs
like the R-1000's and those that have a REAL 50 ohm input.

<Reading this line is illegal.....>

It's quite interesting that this subject
should come up. As has been said, (here) in the
bay area they have been poking around for "funny"
antennas, and harassing owners of said equiptment.

I know a couple whom this has happened to. They ,
apparently , are aiming to scare people into paying
HBO for doing something that they have every right
to do (have a VHF antenna). It's really not too
funny the kind of things they're trying to pull.

Ok, *SUPPOSEDLY* they can tell if a person is actually
using HBO by analyzing his / her antenna. It is
my guess that they would (theoretically) use
a directional antenna, and look at the reflected
signal from said antenna..... Doesn't that seem
like a bit of a double standard? Sending
people to poke around people's backyards, and possibly
"monitoring" the signals from a person's antenna???
THAT's what I call unauthorized butting in to
signals / privacy.

All that is nothing new, but as an sidenote, look
into the cordless fone issue that has been recently
discussed in fa.telecom. I think a decision was made...
"If a reasonable expection of signal privacy was
intended and implemented..... monitoring is a no-no..."

Well, then note this fact: near where I live

there's a transmitter link / repeater for it
of some kind. This link isn't "scrambled". The signal
from this thing (around 87Mhz...) actually cuts
into the bandwidth that is on low-end FM, and such.
In fact, I know of a person (I have witnessed this)
who can , with *NO* special antenna, tune his tv
to ch#6, and receive decent chroma + sound from it
with very little tweaking of any kind! (No antenna now..).

Surely, this isn't "Reasonable expection of privacy...."?!

Can anybody tell me what type of "scrambling", and
what freq. the main vid + sound carriers are
"supposed" to occupy? Is it usually this bad?
I mean, even el-cheapo sine-wave scrambling
techniques would seem to work better..... As I said,
I don't know how HBO actually funkys up the signal,
but would be interested to hear. I'm sure, whatever they
do, they can't be justified is this type of "antenna search".

(That they do it at all, would indicate their expection
of privacy isn't high. Do you see SHOWTIME doing that?)

Please send any & all
comments you might have
either to the net, or:

Tuners no good for receivers? Ah, this is not so! My ICOM R71A manual says that "for best performance" one should have an antenna tuner to ensure that the receiver sees 50 ohms (or as close as possible). And sure enough, an antenna tuner made a big difference in signal catching capability. I should add that I don't believe that my "receiver is so poor that [it is] limited by received signal strength and receiver front-end noise."

In any case, I no longer use an antenna tuner since I now have a McKay-Dymek DA 100D active antenna. (I couldn't put up an antenna in my new apartment, so I bought this and sat it on a window sill). The DA 100D presents a nice load to the ICOM, and works out better than my previous antenna tuner/fire-escape antenna. I recommend this antenna to anyone who is in a similar predicament.

The ICOM ht series radios have a characteristic of the transmitter not unkeying exactly when you unkey the PTT switch. This causes a delay before the receiver comes back on. This is a problem when used with repeater telemetry that relays repeater status and such.

Question ?? Does anyone know of a remedy to this ICOM characteristic?? I won't call it a problem because it probably doesn't affect everyone.

I can personally vouch for the fact that some swr indicators built into antenna tuners are "off"! A friend of mine has a MFJ tuner (not sure of the model) with a built-in bridge. When he adjusts the tuner for minimum reflected, the power out of his TS-430 is half of what it should be. Adjusting the tuner using a Bird wattmeter, everything is as it should be. The MFJ bridge then indicates about 1.8 to 1.

I noticed the same thing with my old Heath swr bridge on my TS-930.

As to someone's comment about not needing a tuner for receivers; This may be more true with older receivers with tuned input circuits such as Hallicrafters or Hammarlund or especially those with tunable preselectors such as Drake or the Yeasu FRG-7. However with receivers

that have a fixed broadband front end, such as the Kenwood R-1000, etc. a tuner makes quite a difference, especially at lower frequencies. True, this may not affect the signal to noise ratio much, but I have seen cases where on 80 meters a tuner can make a difference of more than 10dB. These newer types of receivers want to see 50 ohms! I should further say that the tuner is especially useful when using some random length of wire for an antenna, not one that is resonant at the frequency used.

Concerning tuners that have a balun to feed a balanced line; This is a compromise situation. Balunes are only good for a narrow impedance range and then only good if the load is not reactive. This is seldom the case with open wire fed antennas. The balun should be between the rig and the tuner where it sees a resistive load. So far as I know, Palomar is the only one that has used this approach. For feeding a balanced line, the best bet is still something like the old Johnson Matchbox, or one of the handbook circuits especially made for the purpose.

As for an antenna matcher not being needed on todays' SWL receivers:

If the antenna matcher has the appropriate band pass/reject response,
it will help keep strong broadcast band signals out of a broadband
receiver on VLF and HF.

[eat a peach]

The most distressing thing to hear is the secretary of state discussing
problems or passing information over a clear radio, but it happens all
the time.  Just listen to HF in the 11.200 to 11.300 band and you will
```

here just about everyone of importance talking around the subject.
The fact that the military spends billions on communications gear, doesn't
mean they use it. Usually the operator is lazy and just gets a frequency
the fastest way he can. "get me a freq as soon as possible I must speak
to the president" and the operator says gee not again, Oh piss I'll just
give him the HF. The easiest way to determine an aircrafts communications
capability is to look at it's antenna's. (you can't tell which ones are
the bogus ones) Don't forget to examine the skin for bumps which house
some of the antenna's. The reason for bumps is because the maintenance
types have to fix them sooner or later.

FOR SALE: Hallicrafter HT-45 "Loudenboomer" linear amp. 80-10 meters.
This is a desk top amp with a separate power supply (solid state rec-
tifiers). The amp has a single 3-400Z tube and runs 1000 watts DC input.
I have added a low voltage control circuit that is keyed by the
transceiver that switches the standby bias and rf bypass relay.

asking $250

Hi Allen,

Yes, there is a way to get updates to the call book (the one put out by the
call book company). If you write them a letter they can give you the info
on that. They put them out 4 times a year, both foreign and U.S. updates.

Though I believe it is not too cheap. I used to get it when I first became
a ham. Since the ARRL has started putting out their own book, you might
also get in touch with them.

There are several reasons why an antenna tuner can be benificial on an
receiver as well as on a transmitter.
Probably the most siginificant is the ability to improve selectivity throug
another tuned stage - given the amount of QRM around these days (especially
on 40, 20, & 15) this can be what you need to get that signal out of the noise.
The impedance match won't hurt you either but that's not too critical on
receiving (of course, that's why you want a tuner for your transmitter).

A great idea, but what can the US Government do to keep some international
shortwave types from jamming 40 (e.g. Radio Moscow)?

My 73 magazine subscription is up for renewal and have thought of dropping it but have come up with an idea. If there is enough interest I might start a routing list, and circulate the magazine at HO, HOH, WB, NP etc. and then finally back to me. I would ask for $2 a year, let's say, unless there was more interest and then I could lower the price.

Let me know if you are interested, if I get at least five people, I'll gladly start it up.

From the "Radio Communications Report", September 10, 1984:

FCC to Allow Access to Data Base

WASHINGTON - The FCC has voted to allow the public direct remote access to its computer data bases, with private land mobile and general mobile radio services' files expected to be the first on line.

The Agency's Aug. 8 ruling (Gen. Docket 83-483) comes in response to a proposal filed by the Association of Federal Communications Consulting Engineers (AFCEE), which originally sought direct remote access to FCC licensing information. While FCC files are presently available in computerized form on a restricted basis from the U.S. Department of Commerce's National Technical Information Service, there is no direct access to the data.....

.....the NTIS would act as account manager for a third party contractor without physically handling the files in the direct access mode....

.....The FCC noted that files from private land mobile and general mobile radio services are structured to permit timely offloading and updating of this information to the third-party computer.

Donald Enty, chief of FCC Managing Director's Planning and Analysis Division, said he expects the FCC to have the system commercially operational in June, 1985.

I've never seen much reason to use an antenna tuner on a rcvr on HF,
so I read with interest the articles on the net advocating the practice.
Two reasons have been given, neither of which I find convincing:

1. "It will increase your S meter reading by an S unit or two."
But in the great majority of cases on HF, if you are having trouble
copying a signal it is because it is weak WITH RESPECT TO an adjacent
signal or atmospheric or power-line noise, NOT because of ABSOLUTE
weakness. Better antenna tuning increases signal AND interference/noise
alike. (And if you're NOT having trouble copying the signal,
who cares about the extra S units?)

2. "The antenna tuner is another tuned circuit, hence more selectivity,
which should be helpful given all the QRM on 40 and 20 meters." (Approx
quote.) But when people talk about the "QRM on 40 and 20" they are
talking about QRM on the SAME FREQ or within a couple of KHz of the

desired signal. No antenna tuner is going to help with that.
(If you have a kilowatt xmtr a few hundred yards away, operating a
few hundred KHz away from the signal you're trying to copy, the
extra tuned ckt could help, but that is clearly a special case.)

I don't know about the TS-430, but on synthesized VHF radios such
as the Kenwood TR-9000 (which I have) there is a mechanism which
explains small frequency calibration errors.

Very few radios are actually synthesized to such small frequency
steps such as 100 hz; this makes the phase lock loop design much
more difficult. Instead, they typically have two oscillators which
are mixed to generate the final LO signal: a "coarse" synthesized generator
which operates on, say, 10 khz steps, and a "fine" conventional analog VCO
which is operated over a relatively small range (10 khz) with a control
voltage generated by a D/A converter. This means that while the
frequency accuracy over a wide range will be fairly good, there may
be small (several hundred hertz) errors which cyclically repeat due to
nonlinearities in the D/A converter or the VCO (which is often a crystal
oscillator and a variable capacitance diode.) There can also be
nonlinearities when tuning through a "coarse" frequency step, e.g.,
a 10 khz boundary on the TR-9000 when the PLL synthesizer changes
its output by one step and the analog VCO must sweep from one end of
its range to the other. This is particularly noticeable on the TR-9000
in lower sideband.

Oh oh!! Time for my two cents. (Is that really worth that much?)

I have a book on radio theory from National. They go to some great
lengths about the front end circuits for their broadcast radio
circuits. They claim that there is a certain amount of extra gain
that you can get by making the antenna appear as a capacitive load
to the radio systems front end. I don't have the book in front of
me but if anyone is interested, I'll reference the article and get the
National book number. Back to the subject at hand, it applied in
the article only to antennas on a large ground plane on receivers
with inductively tuned RF sections (i.e. your standard detroit car
radio) but I wonder how much of their principles would apply to
the case of tuners on receivers?

<----------   bugs away   -------------->

   I am very interested in the reviews of the Uniden CR-2021.

   Pleas coudl someone tell me if it uses a battery pack and if so the voltage. It looks as if it would make a fine emergenecy/survivalist radio. Solar cells of the 6v/12v type are reasonably priced and are quite capable of recharging NiCads for intermittent use.

UB 40

There will be volunteer examinations conducted at the Lafayette
Hamfest in Lafayette, Indiana on August 19,1984. Exams given
include Novice through Extra. The exams will be given in the
YMCA Building just north of the Tippecanoe County Fairgrounds on
Teal Road in Lafayette, starting at 12:00 noon sunday.

To reserve a spot for yourself, send a note (hardcopy) to:

David Andersen
3240 McCormick Rd.
W. Lafayette, IN 47906

containing the following information:

License class currently held (or if you don't have a license, say so)
License class desired for this test session.
Any special problems that we should know about pertaining to your
exam session.
Your name.

Hope to see lots of new upgrades that sunday.

**** UoSAT Bulletin-83/84   20th July 1984 ****

** UoSAT-OSCAR-9 Status **

Following problems encountered loading the bootstrap loader last Friday (the 13th!), Oscar-9 was left generating an all-too-familiar tone as the corrupted loader branched around its checksumming routine, turned the 145MHz beacon on and then promptly crashed! Valiant efforts - including the modification and use of Oscar-11 command equipment - were made at Guildford to remedy the problem using the 438MHz uplink, but due to a design feature, this uplink is dependent on the 144MHz squelch, which frequently stays open for prolonged periods. Persistence paid off, however, and the beacon was finally turned off on Thursday 19/7/84. Normal service according to the schedule below will hopefully be restored.

** UoSAT-OSCAR-11 Status **

This report combines the news from the past fortnight's operations...

The past fortnight has primarily been one of consolidation prior to boom deployment operations, expected within the next two or three weeks. The opportunity has been taken to test a number of the other experiments on the spacecraft, although most of these will not be operated further until the craft is locked pointing downwards. Much more analysis of the spacecraft's attitude both now and after gravity-gradient boom deployment has been performed, and software to run in real time on the ground-station computers has been written and tested.

The pyrotechnic bolt-cutters securing the boom tip-mass to the top of the spacecraft were fired on orbit 1909.

A daily account follows:

Friday 6/7/84

Monitored the TORQUEC automatic magnetorquing program and collected more data in dwell mode to analyse.

Saturday 7/7/84

More monitoring

Sunday 8/7/84

Yet more monitoring

Monday 9/7/84

Loaded the ODATA whole-orbit telemetry recording program at 20:21:46, recording channels 1,2,3,10,50,52. Analysis shows that the spacecraft remains adequately 'locked' to the earth's magnetic field for only about 15-20 minutes after the automatic magnetorquing program is turned off - this affects our planning for boom deployment. Automatic magnetorquing was re-enabled on next pass.

Tuesday 10/7/84

The boom tip-mass release pyrotechnics were fired on orbit 1909.

During the evening, a new version of TORQUEC with an interruption facility was tested. This allows updates to the magnetorquer firing parameters to be loaded without re-loading the whole program. The test was successful.

Wednesday 11/7/84

ODATA was run at 18:25:34 to look at the temperatures of the top and bottom panels of the spacecraft as an independent measurement of attitude. The channels monitored were 1,2,3,19,29,59. Again, TORQUEC was re-loaded on the subsequent pass.

Thursday 12/7/84

TORQUED was loaded and tested successfully. This program contains an additional loop which allows a sequence of commands to be uploaded and sent to the telecommand system at pre-determined intervals. This will allow us to deploy the boom under automatic control, possibly allowing the operation to be performed elsewhere than over England. This will allow more flexibility in the boom deployment planning.

Friday 13/7/84

The Digital Store and Readout experiment was powered up on orbit 1958, and data from the 1802 computer UART was recorded

and re-played successfully. Apart from the serial input, the DSR also has very fast parallel inputs from the CCD camera and the Radiation experiments and is the only device which can store the data from these (at least in the short term). The DSR features an extremely sophisticated readout mechanism, complete with synchronisation characters, a Hamming-encoded memory address, data protected by a CRC code and the whole block enclosed in a Fire code for burst error correction. A datasheet explaining these is under preparation, but the initial checking of the downlink data received is taking lower priority than many other current activities.

Also on Friday 13/7/84, the 435MHz beacon was tested briefly, and found to be working well. Due to the initial command problems, this beacon will not be activated again until after g-g stabilisation, when the effects of blocking the 438MHz uplink will be measured.

Saturday 14/7/84

TORQUEE - the latest of the automated magnetorquing programs - was loaded and run. This program has the added feature of concurrent ODATA storage and playback, so that the effect of magnetorquing over the whole orbit can be evaluated without interrupting it. After an orbit with a decoy checksum, the first successful run was on orbit 1973, recording channels 1,2,3,10,50,52.

Also on orbit 1973, the 2.4GHz beacon was powered up for the first time. This beacon also performed well, and was used a few times over the weekend. It is hoped, after more checks of possible effects on the uplinks, to be able to leave this beacon powered for longer periods when the power budget allows.

Sunday 15/7/84

TORQUEG was tested. This version allows the ODATA recording to be reset by ground command, preventing the program from having to be re-loaded. This worked well. The ODATA was reset after various tests at 21:03:10, this time displaying channels 1,2,3,35,50,52.

Monday 16/7/84

Further ODATA resets (using channels 1,2,3,35,50,52) were done at 08:48:25 and 11:59:50 as 2.4GHz tests continued.

TORQUEH - outputting ODATA with non-sequential channel numbers - was run during the evening - details of timing unavailable.

The evening was also spent testing the Radiation detectors, but this was not particularly successful - as expected - because they draw more current than the supply trips allow at this

temperature. More tests will be done after stabilisation is complete.

Tuesday 17/7/84

The CCD camera, dumping to the DSR, was tested for the first time. After a few false starts configuring the memories, a test image was taken. Analysis of the DSR downlink format and development of the decoder and display are in progress, but the initial results look promising.

Wednesday 18/7/84

This was spent running some uplink and receiver tests.

Thursday 19/7/84

The ODATA section of TORQUEH was reset at 09:02:14, which highlighted a problem in the program. The program was re-run around 12:20, but the reason for the earlier problem is not yet fully known. The program was again reset at 20:13:45, to channels 1,2,3,35,50,52.

** UoSAT-OSCAR-11 Operations Schedule **

We will be using dwell telemetry, with channels 01, 02, 03, 61 and 67 transmitted in a one-line frame with the standard checksum, thus providing very fast data for ground analysis. (Note channel 67 has been added to monitor the computer command. The MSB of channel 67 is the magnetorquer demand flag (set when commands sent if they are enabled), the other 3 bits in the first digit giving type of firing (based on a z-field change or a transverse field change) and the bottom 8 bits giving a measure of the transverse change.)

** UoSAT-Oscar-9 Schedule **

The 2.4GHz beacon will be in use this weekend.

Friday	Load bulletin
Saturday	Bulletin / 1200 bd telemetry / Digitalker
Sunday	Bulletin / 1200 bd telemetry / Digitalker
Monday	Whole-orbit radiation data
Tuesday	Checksummed telemetry
Wednesday	CCD image
Thursday	Whole-orbit telemetry data
Friday	Load bulletin

Based on the response to our questionnaire, we are considering generating Digitalker for the educational 'market' on Mondays, now that we have started transmitting CCD images on Wednesdays. Radiation data will be scheduled occasionally.

** UoSAT-Oscar-9 bulletin #82 **

Last week's bulletin filled the memory of the 1802 computer leaving only 3 bytes spare! More notably, a new cross assembler written by G8NEF made it possible to alter the bulletin slightly, compile it, load 16kb onto the spacecraft and run it all during a 32 degree elevation pass, lasting some 12 minutes. The compilation time of around 30 seconds compares very favourably with the 20 or 25 minutes typically taken with the previous facility. The assembler also features UoSAT checksum generation and loader support routines.

** General News - UoSAT Newsletters **

The following information has finally been printed at UoS. The full pack will be sent to all enquirers who have written to us since February this year, just ask for individual sheets if you want them!

Newsletter - General status of UoSAT activities at June 1984
Datasheet 1 - UoSAT Project Summary
Datasheet 2 - UoSAT-1 Technical Data Summary
Datasheet 3 - UoSAT-1 Orbit Geometry, Tracking and Groundstation details
Datasheet 4 - UoSAT-1 Telemetry
Datasheet 5 - UoSAT-2 Project Summary
Datasheet 6 - UoSAT-2 Technical Description
Datasheet 7 - UoSAT-2 Reception, Data formats and Telemetry equations
Datasheet 8 - UoSAT-2 FSK demodulation using BBC Micro.
Questionnaire - As transmitted on this bulletin

Sheets describing the DSR data format and how to assemble this data to make up CCD images are under preparation as time allows.

** Weather Satellite Status **

* The NOAA-8 spacecraft is being decommissioned following a failure of the primary oscillator which commands the timing of the gyros and attitude control system. Engineers have not been able to switch over to the redundant oscillator as the primary oscillator has not yet failed completely.
* The NOAA-6 spacecraft has been re-activated to replace the failed NOAA-8 data.

* NOAA-7 will complete its planned operational lifetime this summer, but is continuing to perform well.

* The NOAA-9 spacecraft is currently scheduled for launch on 23 October 1984.

* METEOR-2-7 remains active on 137.3 MHz

* METEOR-2-9 has not been heard recently.

* METEOR-2-8 is now active on 137.85 MHz.

** Thanks for Reports & Questionnaire Returns **

Larry,
   ** UOSAT-OSCAR-11 Gravity Gradient Boom Deployment **

   Following several days final preparation and rehearsals,
```

the UO-11 gravity gradient boom was deployed under on-board computer (OBC) control at 10:35 gmt today 24 July on orbit 2113.

The automatic magnetorquing manoeuvres continuously executed by the OBC over the last few weeks, had aligned the spacec closely to the geomagnetic field vector and reduced residual motions (wobble) to a very low value. Following final confirmation at AOS at Surrey on orbit 2113, the OBC was given instructions to terminate the magnetorquing routines and deploy the boom for 15 minutes taking the spacecraft out of range of UoS. Spacecraft telemetry indicated reasonable boom motor current and correct operation of the OBC. The OBC recorded X,Y,Z, +5V current and boom & computer status channels automatically throughout the following orbit, whilst the boom was being deployed, to monitor gravity gradient capture.

The stored data was dumped at UoS on the next orbit (2114) and confirmed the correct operation of the OBC routines and preliminary analysis of the stored Navigation Magnetometer data indicates successful gravity gradient capture.

NOTE

Gravity capture may occur successfully WITHOUT correct boom extension due to the excellent initial attitude of the spacecraft reliant solely on the asymmetric body shape - residual energy and the effect of perturbing forces, however, are likely to cause this condition to deteriorate quite rapidly if the boom has not deployed to a significant extent.

Data gathered over the next day or so will confirm successful (or otherwise) gravity gradient stabilisation and will indicate the degree of libration.

The most obvious effect of gravity gradient capture is that the spacecraft will now make only one rotation around the earth - rather than two when magnetiacally stabilised. Residual energy before boom deployment will translate itself into subsequent libration after GG-lock.

More news will be forthcoming as we have it!!

Martin, Neville, Roger, Stephen + UO-11!

In my anger I forgot one of the fundamental rules of the net: no sarcasm. So, for those of you who did not read the message for the words, here they are with in black & green. (vote card at end of article).

(1): I oppose the code as archaic, but I can see the need for it as an emergency communication means. It was generally agreed that 5 wpm is acceptable. *I* am currently working on a computer program so I will learn code at *25* wpm, therefore several years in the future I will still be able to copy emergency transmissions. However, that is a personal choice, rather than one I would force on others.

(2): Whether you like it or not, a lot of traffic is going to travel in packet & digital form, and there will even be transceivers that can send *only* digital signals. Therefore, if everyone agrees that Morse is required for emergencies, it follows that digital should also be available for emergencies. I specified the digital control of transceivers because that is the easiest way of ensuring that if you are the only station in range of a digital emergency transmission, all you need to do is press the 'ascii' button in and copy the message.

(3): That heavy sarcasm on my earlier messages was because of the point recently made my another author -- a large number of you come across to non-hams as the playground bullies who don't want to let the new kids in. Quite honestly, I was just about to throw away all of my books on ham radio after monitoring this new group for the last year, and had posted my previous article (of several months ago) in a last, desperate attempt to disprove my suspicions. I had been planning to remove this group from my .newsrc file and discard all of my ham books when this discussion came up. Frankly, it was only because of those who at least considered the no-code option (even if they decided they still believed code is best) that I decided to start seriously studying for the exams. But, once again I have a sick feeling in my stomach; that all I see implies:

(4): Within 25 years, ham radio operators will have lost almost all bandwidth below 220 MHz, unless things change very rapidly.

I grew interested in ham radio not because of the prospect of talking to someone around the world (or in orbit), but

> because in college I saw just how much of radio we now take
> for granted was developed by hams. As I recall, it was hams
> who developed AM (as opposed to spark-gap generators), SSB,
> spread-spectrum, and several other important techniques.
>
> Now, the hardware is unable to progress much further (because
> of Nyquist's theorem), at least below the microwave range, so
> *needed* progress must come from a different source -- the
> `software'. Packet promises to offer better capabilities than
> Morse, and I can think of several ways to improve telephony by
> using techniques developed for speech sythesis. Yes, these
> techinques will require years to perfect, but there is the
> promise of fitting far more hams within the same bandwidth.
>
> I fit in because I am in that very narrow age group that feels
> confortable with both analog & digital equipment. (I was born
> in 1961). The computer classes at the local university had just
> begun to offer something besides card-input to the remote mainframe
> the year I entered (and you could still see slide-rules), and the
> year I graduated the CS dept. was running some intro courses on
> Apples & IBM PCs. (1978 vs. 1983) This is important because in
> very few years nearly all prospective hams will be interested in
> digital communication *only*, and they will turn away if they do
> not see it there. (Packet would be the *main* mode, not phone).
> To them, anything that doesn't involve bytes and registers will
> seem just as baffling as the 8080 must have first seemed to people
> who grew up with vacuum tubes, but they (the current teens and
> beyond) won't have the same incentive to learn.

In summary, I am willing to work with you (the ham community), if
you are willing to work with me (part of the `hacker' community).

If you feel that the heavy computer `flavor' I and my type will
bring in will destroy the ham community you know and love, let me
know now and I will toss my books and warn all others who would
intrude on your turf. And for *my* children, I will watch so that
when the FCC decides that ham radio no longer is serving its
various purposes (including R&D of new techniques), I or my friends
will be there to step with the INCN (independent node computer
network).

Finally, I know that hams have already developed packet, but you
must realize that that is only a first step. What you need to make
packet a useful tool is not a digital AMSAT, but software & system
engineers who can bring these independent transceivers together
into a working system. I don't consider two hams connected my
packet a working system, not when compared to the potential of all
local hams being connected into a coherent whole.

Bruce Giles

giles.ucf-cs@Rand-Relay

For those who wish to respond directly, here is the voting card:

[9 8 7 6 5 4 3 2 1] Should code be required?

[9 8 7 6 5 4 3 2 1] Should more or less knowledge of analog devices be reqd?

[9 8 7 6 5 4 3 2 1] Should more or less knowledge of digital devices be reqd?

9 = much more 5 = about the same 1 = much less.

For example, my vote would look like this:

[9 8 7 6 5 4 3<*>1] Should code be required? (5 wpm min, more encouraged)
(but not reqd for any license).
[9 8<*>6 5 4 3 2 1] Should more or less knowledge of analog devices be reqd?

[9<*>7 6 5 4 3 2 1] Should more or less knowledge of digital devices be reqd?

RECENTLY I HAVE NOTICED A GROWING INTEREST IN PACKET RADIO ON
USENET. IN ORDER TO SHOW WHAT IS HAPPENING IN THE WASHINGTON D.C.
AREA I HAVE CAPTURED A SAMPLE SESSION ON THE AMRAD BRIDGE OR HF/VHF
GATEWAY SYSTEM. THE SYSTEM WAS DEVELOPED BY BOB BRUNIGA, WB4APR/W3
AND IS ACCESSED VIA THE TWO LOCAL DIGIPEATERS (WB4JFI5 - AMRAD AND
W3VD - AMSAT/JOHNS HOPKINS APPLIED PHYSICS LAB).

THE BRIDGE HAS PROVEN VERY EFFECTIVE AT ALLOWING 2 MTR STATIONS TO

COMMUNICATE WITH DISTANT STATIONS ON 10 MTRS.

HOPEFULLY THIS DATA WILL BE SELF-EXPLANATORY. I WOULD BE HAPPY TO
ANSWER QUESTIONS, BUT IT WOULD PROBABLY BE BETTER TO ADDRESS THEM TO
EITHER AMRAD OR AMSAT. PLEASE BE ADVISED, I CAN NOT RESPOND TO QUESTIONS
COMING FROM THE ARPANET.

For those in need of an inexpensive and readable copy of the FCC regs
and related stuff I'd like to recommend this publication. It presents
rule interpretations using QST's "Washington Mailbox" format as well as
band plans, exam info, technical standards, etc. For those who want
the actual regs, the last 35 pages are a complete reprint of part 97.

Not a bad buy for 3 dollars, but make sure you get the 2nd (1984)
edition. How many remember when the "License Manual" was 50 cents?

Somebody mentioned Desecheo Island; worked it on
Mon. July 23 at about 0000z on 14025. Call was WP4ATF/KP5.
Haitian call/KP5 (I forget the call) was heard on SSB.
Didn't bother since I got the cw operation. (I just go
for mixed DXCC, saves lots of grief :-))

     I'm thinking about purchasing the ICOM IC-751 XCVR.
I would like to here from anyone who has this rig.

     Are there any problems with it?
     Is it as good as ICOM says?

Let's see if I have this straight. Morse code is being sent
in this newsgroup by having .'s and -'s encoded in ASCII,
embedded within text messages, packed in various protocols
(certainly uucp, maybe TCP/IP, probably packets over various
Ethernet links) and read on CRTs and printers all over the
world. I think this is a wonderful commentary on something.

**** UoSAT Bulletin-85   27th July 1984 ****

** UOSAT-OSCAR-11 Gravity Gradient Boom Deployment **

Following several days final preparation and rehearsals, the UO-11 gravity gradient boom was deployed under on-board 1802 computer control at 10:35 gmt during orbit 2113 on 24th July.

The automatic magnetorquing manoeuvres, continuously executed by the 1802 over the last few weeks, had aligned the spacecraft closely to the geomagnetic field vector and reduced residual motions (wobble) to a very low value. Following final confirmation of auspicious deployment conditions at AOS at Surrey on orbit 2113, the 1802 was given instructions to terminate the magnetorquing routines and deploy the boom for 15 minutes taking the spacecraft out of range of UoS. Spacecraft telemetry indicated reasonable boom motor current and correct operation of the 1802. The 1802 simultaneously recorded X,Y,Z, +5V current and boom & computer status channels automatically throughout the operation whilst the boom was being deployed and during the following orbit, to monitor gravity gradient capture and spacecraft operations.

The stored data was dumped at UoS on the next orbit (2114) and examination confirmed the correct operation of the deployment routine and preliminary analysis of the stored Navigation Magnetometer data indicated successful gravity gradient capture.

Gravity capture could, however, occur successfully WITHOUT correct boom extension due to the excellent initial controlled attitude of the spacecraft reliant solely on the asymmetric body shape - any residual energy and the effect of perturbing forces, however, would be likely to cause this condition to deteriorate quite rapidly if the boom had not deployed to a significant extent.

Data gathered over the following days confirmed, however, that the spacecraft maintained successful gravity gradient stabilisation and showed no evidence of severe libration.

The most obvious effect of gravity gradient capture is that the spacecraft will now maintain the communication antennas and camera pointing at the earth. Residual energy before boom deployment will translate itself into subsequent libration after GG-lock which will be monitored and minimised using magnetorquing routines similar to those used during initial attitude control manoeuvres. The digital sun and earth horizon sensors will now be activated to determined the spacecraft's attitude and degree of libration.

Once the spacecraft GG attitude behaviour has been analysed, it is probable that the spacecraft will be spun very slowly around the Z-axis in order to improve the internal temperatures - currently running somewhat cool. Introducing a very slow Z-spin does, of course, interact with the GG stabilising forces but only to impart a small forward or backward 'tilt' of a few degrees dependent on spin rate.

Gravity gradient stabilisation of UO-11 is the culmination of many months of preparation and many weeks of spacecraft activities - most of which has not been visible to the outside world! It has been very demanding and has necessitated the use of considerable facilities and required a particular, dedicated effort from the UOSAT Team - particularly Stephen (Attitude, Stabilisation & Navigation Analysis), Roger G8NEF (Spacecraft Software) and Neville G8NOB (Ground Station Software). A more detailed account of the Attitude Control and GG activities will be prepared in due course.

A day-by-day account follows:

Saturday 21/7/84

TORQUEH (the 1802 program which actively controls the magnetorquers in conjunction with reading the navigation magnetometer, records and replays whole orbit data and runs command timing loops) was further exercised as well as re-initialising its ODATA function at 21:29:40.

Sunday 22/7/84

TORQUEH was re-loaded following minor modifications. Yet further confirmations of spacecraft attitude taken!

Monday 23/7/84

Morning - tests of final ground "deployment decision" software were made by switching the magnetometer on permanently and watching the fields changing. Residual oscillations of under 10 degrees were encouraging.

Evening - A full rehearsal of the boom deployment operation was run over 3 passes. The boom deployment commands were substituted by commands which were equally visible on the telemetry status points but otherwise harmless! After the ODATA was dumped, active magnetorquing was re-enabled.

Tuesday 24/7/84 - Boom deployment

Orbit 2112 - While holding the telemetry system in dwell mode (which prevents ODATA from recording since all channels are not found), the TORQUEH ODATA segment was reset, and active magnetorquing resumed. The spacecraft was left until LOS transmitting dwell telemetry to the ground analysis software.

Orbit 2113 - Sending one command told the 1802 to turn the z-magnetorquer on continuously, to allow the ground software to take a precise fix of the spacecraft attitude. After about 3 minutes of data, Stephen finally confirmed a suitable attitude, and the telemetry system was switched out of dwell mode to enable ODATA recording to start at 10:35:00 (approx). The channels recorded were 1,2,3,41,61,67. The last two record hexadecimal numbers - sorry if your ODATA program expired at this new facility!

At 10:35:20, a command to the 1802 turned the boom motor on for a 15.0 minute deployment and we watched the telemetry anxiously. An anomaly on the 5v current sensor prevented us seeing the true current, but the 14v bus was as expected and the motor was left running as the spececraft disappeared below our horizon.

Orbit 2114 - Telemetry at AOS looked good, with the boom motor off and a good battery voltage. After taking the stored ODATA dump, the magnetorquers were disarmed and ODATA was reset at 12:19:23 to record channels 1,2,3 and 52. The real-time dump of the ODATA looked most encouraging.

By the evening, the next ODATA dump to be analysed confirmed a stable gravity gradient lock. More rapid dumps (always using channels 1,2,3,52) were made after resets at 18:37:53 and 20:09:45.

Wednesday 25/7/84

Another ODATA dump was initialised at 09:35:30.

The DSR was powered up on orbit 2127 and a CCD image taken. This was blank (following a day's analysis with hastily-assembled test equipment!) due either to incorrect pointing (we still have an unquantified amount of libration) or incorrect exposure. More experiments will be scheduled as soon as possible.

ODATA resets were initiated at 11:19:23 and 12:53:44 and 19:12:00.

Thursday 26/7/84

ODATA resets were at 10:12:00 (approx) and 11:58:18. Attempts to power up the sun sensors were partially successful due to a known problem with their current trips. During the evening, the spacecraft was set to re-transmit audio from the 438MHz uplink to test this uplink at the new attitude. Results were most encouraging.

Friday 27/7/84

The 2.4GHz beacon was tested and found to be much improved in the new attitude. This downlink should prove to be very useful for engineering and high speed data for ground stations which are well-equipped with good receiving and decoding equipment.

** UO-11 Mission Plan **

Gravity gradient stabilisation marks the end of the major spacecraft commissioning phase of UO-11 and now allows us to progress with the commissioning of the experiments. This will commence with evaluation of the DCE and CCD Camera, however a more detailed Plan will be available shortly.

** UoSAT-Oscar-9 Schedule **

The 2.4GHz beacon will be in use this weekend.

```
Friday    Load bulletin
Saturday  Bulletin / 1200 bd telemetry / Digitalker
Sunday    Bulletin / 1200 bd telemetry / Digitalker
Monday    Whole-orbit radiation data
Tuesday   Checksummed telemetry
Wednesday CCD image
Thursday  Whole-orbit telemetry data
Friday    Load bulletin
```

Based on the response to our questionnaire, we are considering generating Digitalker for the educational 'market' on Mondays, now that we have started transmitting CCD images on Wednesdays.

Radiation data will be scheduled occasionally.

** General News - UoSAT Newsletters **

The following information has been printed at UoS. The full pack has been sent to all enquirers who have written to us since February this year. It is available on request.

Newsletter - General status of UoSAT activities at June 1984
Datasheet 1 - UoSAT Project Summary
Datasheet 2 - UoSAT-1 Technical Data Summary
Datasheet 3 - UoSAT-1 Orbit Geometry, Tracking and Groundstation details
Datasheet 4 - UoSAT-1 Telemetry
Datasheet 5 - UoSAT-2 Project Summary
Datasheet 6 - UoSAT-2 Technical Description
Datasheet 7 - UoSAT-2 Reception, Data formats and Telemetry equations
Datasheet 8 - UoSAT-2 FSK demodulation using BBC Micro.
Questionnaire - As transmitted on this bulletin

Sheets describing the DSR data format and how to assemble this data to make up CCD images are under preparation as time allows.

** Weather Satellite Status **

* The NOAA-8 spacecraft is being decommissioned following a failure of the primary oscillator which commands the timing of the gyros and attitude control system. Engineers have not been able to switch over to the redundant oscillator as the primary oscillator has not yet failed completely.

* The NOAA-6 spacecraft has been re-activated to replace the failed NOAA-8 data.

* NOAA-7 will complete its planned operational lifetime this summer, but is continuing to perform well.

* The NOAA-9 spacecraft is currently scheduled for launch on 23 October 1984.

* METEOR-2-7 remains active on 137.3 MHz

* METEOR-2-9 has not been heard recently.

* METEOR-2-8 is now active on 137.85 MHz.

** Thanks for Reports & Questionnaire Returns **

My neighbor, Walt Evanyk W8KSW, is looking for receivers
from the military R22 ARC-5 family. He tells me that he wants
to purchase these regardless of their condition. Even a
receiver that is beyond repair is of interest as a source
of spare parts. If you have one or more of these receivers
or know someone else that does, please tell me or Walt.

David, I'm serious, and wondering if hams are limiting themselves
by only requiring 5WPM. If you are really serious then in order to
improve efficiency you must demand a higher speed. Something on the
order of 20 WPM or higher. This would allow traffic to be passed
almost as fast as ASCII. I believe all hams should be required to
demonstrate 20 WPM minimum if they want morse code. Any less would
cause tremendous delays. That poor bastard on the highway, with his
blood draining out as he taps SOS with his battery cables at 5 WPM
would wish he had improved his speed.

PS To those people who have been complaining about my spelling,
    I didn't realize that you demanded so much english accuracy
    on this note. I think I'm doing pretty good since I just
    learned the language 5 years ago. (Russian) And I would
    like to relay something I learned on the bus the other day:

Here are some responses to the questions of HF Transceivers. It appears
that the   ICOM IC 745   YAESU FT 757   KENWOOD TS 430 are all
in a similar class of General coverage receiver, hamband (WARC,too)
transmitter. We've heard from owners of the FT 757, how about anyone
with an IC 745 or TS 430?

By the way here are some prices:

	IC 745	FT 757	TS 430	
Portland Radio	$789	$769	?	over the counter
ege		$760		mail order (QST)
AES	$770			mail order (QST)
Moory	$649		$669	mail order (QST)

In the past I've had mixed results mail ordering electronic equipment.
I prefer dealing over the counter.

> 3. memorizing of mode along with frequency
> 4. all-mode squelch control
>
> Leaving aside all the nice digital control circuitry, the Kenwood is "left in the dust" by the older R4B when trying to copy a signal in the presence of other strong signals (e.g. Field Day). There is an odd asymmetry in the type of controls available for use in CW and SSB. As an example, the dual variable bandwidth control functions in SSB but not CW mode.

****

I have a Yaesu FT757-GX and I think it is terrific.

It has general coverage receive, dual vfo's, full breakin (QSK), eight memories, USB, LSB, CW wide, CW narrow, AM, FM; modes all as standard features.

I have noticed that Kenwood and Icom are lowering the prices of the 430S and the 745, obviously to compete better with the 757, but they still cost more and do not have the narrow CW filter, FM and AM (430S) built in.

Just in case anyone thinks that I am total biased against Icom and Kenwood, if you do not want general coverage receive capability, then I think that the Icom 730 is an execellent transceiver for pure ham band work.

PETER...

I ALSO HAVE A 757. MINE IS AT YAESU FOR REPAIR AFTER A 61ST DAY FAILURE. I ATTENDED THE HAMCOM CONVENTION HERE IN DALLAS RECENTLY ES THE YAESU BOOTH WAS ATTACKED BY ANGRY HAMS COMPLAINING ABOUT THEIR 757'S. IT SEEMS THAT MANY OF THE 757'S WIL OSCILLATE WHEN OPPERATING 10 ES 15 METERS. BE SURE AND CHECK YOURS FOR THIS. SOME OF THE PEOPLE WERE ALSO SAYING THE FM DIDN'T WORK. TOWARDS THE
END OF THE CONVENTION, THE YAESU PEOPLE WERE GETTING VERY FRUSTRATED WHEN ANYBODY EVEN MENTIONED THE 757. I STILL THINK IT HAS THE POTENTIAL OF BEING A VERY GOOD RIG BUT THEY ARE QUITE OBVIOUSLY HAVING SOME PROBLEMS WITH IT. ANY WAY, I HAVE BEEN ASSURED BY THE YAESU SERVICE MANAGER THAT MINE WIL RETURNED WITH THE LATEST UPDATES WHICH IS REASSURING. YAESU CLAIMS THESE RADIOS ARE PUT TOGETHER BY ROBOTICS....PERHAPS MY RADIO WAS ASSEMBLED BY A ROBOT WITH A SAKE HANGOVER??

FOR SALE

Kenwood TS 520 Transciever with CW filter and external speaker.
This is the orginal 520 and has the 12v and 117v power supplies
inside the cabinet. Also has tube finals to help out in high
SWR areas. Great rig for anyone, also makes a good backup rig.
exec. shape inside and out. Asking $475.00 will consider trades
for small moble HF radio or who knows.

I am trying to find a schematic/service manual for an R 390A/URR receiver. Can
anyone tell me where I might be able to get one? I currently have an

"Organizational Maintenance Manual" p/n TM 11-5820-358-20, but it really isnt much of a
technical manual. I am also interested in any mods to the 390 that anyone has made. Thanks in advance.

I just heard yesterday that the FCC has assigned an RM number to
a petition to allocate 216-222 mhz (including of course the bottom
2 mhz of the amateur band) to land mobile. This confirms speculation
based on Robert Foosaner's (FCC Private Radio Bureau Chief) comments
at the ARRL National Convention.

Needless to say, this is a grave development. We NEED that spectrum,
particularly for packet radio linking. There is nowhere else to go
for the high speed FSK links that are being built right now. In particular,
amateur satellite gateway stations NEED 220 mhz as all current
and future satellites use all of the other VHF/UHF bands and the
gateways have to operate in full duplex.

It is becoming pretty clear that this attack is at least partially
based on the rejection of no-code: the FCC considered no-code to
be the amateur's "last chance" to populate the bottom part of
the band. It is quite ironic that the ones who get hurt by this
proposed change (the technically oriented packeteers) are mostly

the ones who argued FOR a no-code license to increase technical
experimentation. However, I suspect that very few of the vocal
anti-no-code crowd ever used 220-222 mhz, or 420-430 mhz, or 1215-1240
mhz, or 2310-2380 mhz...

Anyway, enough sermonizing. I strongly urge everyone to protest this
move with the FCC as soon and as strenuously as possible, even if you
don't use 220. If we don't all hang together as a group when one interest's
spectrum is threatened, then before long we'll have lost much of everything.

The way I figure it, all hams just want to use morse code and ragchew
about antennas and HF is all they need. Lets give the VHF and up
frequencys to someone who would put them to more efficient use than
the hams who don't use it anyway.

I have wondered for twenty years now how Wayne Green has managed to remain
W2NSD/1 (I think thats it) for so long. No hostility is intended here, I
have been reading (and paying for) his rather right wing technical/political
magazine for the same twenty years.

Hmm. Yes I think that is related to ham call sign changes.

Forwarded from Compuserve. This also applies to VFH packet, N'est ce pas?

    Keywords: DEVIATION VHF-FM RTTY MODULATION INDEX MARK SPACE

    A commentary on control of modulation index in
    VHF-FM RTTY.

FROM W2JUP, FARMINGVILLE, NY
DECEMBER 7, 1983
2230 EST

PART 1-
TONIGHT'S LESSON IS FROM THE FIRST BOOK OF DEVIATION. WE WILL READ
THE PARABLE OF THE MARKS AND THE SPACES.

ONE NIGHT AS I MAINTAINED MY SHEPHERD'S PASTORAL WATCH OVER A LOCAL
REPEATER CHANNEL FLOCK, MY EAR WAS CAUGHT BY THE TWEEDLE-TWEEDLE SOUND
OF THE MARKS AND THE SPACES. I LOOKED TO SEE WHAT BYTES WERE THERE,
AND LO! THERE WERE NO BYTES! ONLY SCARS AND UGLY DISTORTIONS UPON
THE SCREEN AND UPON THE SCROLLS OF PARCHMENT THAT FROM MY PRINTER

FLEW.

I CONSULTED THE ORACLE, LIT TWO LEDS FOR CANDLES, AND THE ORACLE SPAKE UNTO ME SAYING, "CLOD, THERE ARE NO TRUE MARKS AND SPACES UPON THY CHANNEL! THESE ARE UNCLEAN AND MUST B SCOURGED FROM THY PAGE! SEEK THEM OUT AND DESTROY THEM, FOR THEY ARE FROM ANOTHER WORLD AND MUST BE CLEANSED!"

SO, AS THE ORACLE BAD ME, I WENT FORTH WITH SWORD AND SCREEN AND SOUGHT THE UNCLEAN BITS AND MARKS AND SPACES. AND, LO!! I DID FIND THEM DOWN A MERE 15 KHZ, ISSUING FORTH FROM ANOTHER REPEATER, FULL OF SOUND AND FURY, AND OF GREAT AND FULSOME VOLUME. SO I DID CAUSE THESE UNCLEAN MARKS AND SPACES TO APPEAR AS IF BY MAGIC UPON THE SCREEN AND SCROLL OF MY TABERNACLE, WHEREIN I DID EXAMINE THEM. AND TRUE AS SPAKE THE ORACLE, THEY WERE INDEED UNCLEAN AND FULL OF SORES AND THE BLEMISHES THAT ARE CALLED SQUARED WAVES.

AND AFTER INVOKING THE ORACLE ONCE AGAIN, I DID SEE THAT THESE UNCLEAN MARKS AND SPACES WERE FROM THE WESTERN SHORES, FROM THE HOUSE OF A FALSE PROPHET, A FRIEND, NEWLY COME UNTO THESE DIGITAL MODES. AND I WENT UNTO THIS FRIEND AND SAID, "FRIEND, WHYFOR ARE THY MARKS AND SPACES UNCLEAN, AND OF A FULSOME NOISE, AN A PLAGUE UPON OUR CHANNEL?" AND MY FRIEND SPAKE UNTO ME SAYING, "FORGIVE ME OH MASTER, I KNOW NOT WHAT I HAVE DONE. I AM NEWLY COME UNTO THIS RTTY ODE AND AM AS A STRANGER IN THE LAND. ANOINT ME WITH THY WISDOM SO THAT I MAY BE CLEANSED AND FIND LOVE ONCE MORE IN THE HEARTS OF MY FELLOW MEN."

SO I SAID UNTO THE NEWCOMER, "NEWCOMER, KNEEL AND LEARN. I WILL TELL THEE OF THE RULE OF CARSON, A GREAT SAGE FROM THE LABORATORIES OF BELL. HEAR! OH NOVICE, HOW IT IS MEET UPON YOU TO LOOK TO THY "MOD INDEX". FOR THY SIDEBANDS DOTH APPEAR UPON A CHANNEL IN THE EAST, AND THE PEASANTS ARE WROTH WITH THEE!. THOU ART TRULY A DEVIANT SOUL, GUILTY OF MAKING GREAT NOISES UPON THE AIR, AND THY MARKS AND THY SPACES DO GROW AND INFECT THE ADJACENT CHANNEL, WHICH IS NOT COOL!"

AND THE NEWCOMER KNELT IN SHAME, AND BEGGED FORGIVENESS. HE SAID, "TELL ME OF THIS RULE OF CARSON FROM THE LABORATORIES OF BELL, SO THAT I MAY CLEANSE MY ACT AND GET WITH THE PROGRAM 'ERE THEY CAST ME OUT AS AN UNBELIEVER AND AN INFIDEL!!"

AND I SPAKE UNTO THE NEWCOMER SAYING, "OH YE OF LITTLE SMARTS! GET THEE TO A TEXTBOOK HAVING WITHIN IT THE RULES OF THE INDICES OF MODULATION. FOR THEREIN LIES THE SECRET WHICH IS IN THE RULE OF CARSON, WHICH SAYS: "A GENERAL RULE FIRST STATED BY J.R. CARSON IN AN UNPUBLISHED MEMORANDUM AT BELL LABS DATED AUGUST 28, 1939 IS THAT THE MINIMUM BANDWIDTH REQUIRED FOR AN ANGLE-MODULATION SIGNAL IS EQUAL TO TWO TIMES (THE SUM OF THE PEAK DEVIATION AND TWICE THE HIGHEST MODULATING FREQUENCY) TO BE TRANSMITTED. IN THE NOTATION DEFINED AS-

BW EQUALS 2(DELTA F PLUS (2F SUB-M))

WHERE BW EQUALS BANDWIDTH, DELTA F EQUALS PEAK DEVIATION
AND F SUB-M IS THE MODULATING FREQUENCY.

THEREFORE, IT IS WRIT-

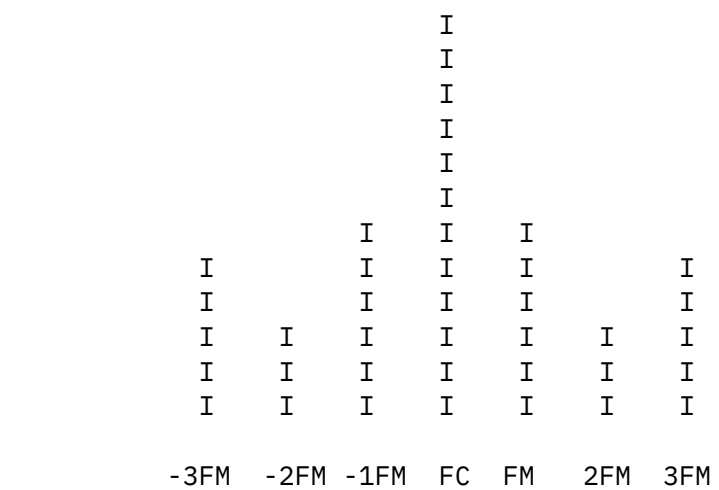
IF THY DEVIATION IS 5 KHZ, AND THY MODULATING FREQUENCY IS
2125 HERTZ FOR THY MARKS AND 2295 HERTZ FOR THY SPACES,
THE RULE OF CARSON SAYS THAT THY MINIMUM BANDWIDTH SHALL BE:

TWO TIMES THE SUM OF (9.250) WHICH COMES OUT TO 18.5 KHZ--
WHICH IS DAMNED WELL GONNA TAKE YOU INTO THE NEXT CHANNEL AND
PISS OFF THE TROOPS!!!

"THEREFORE, OH YE OF HALF A WIT, I SAY UNTO THEE, FORESOOTH!
DROP THY DEVIATION DOWN TO NO MORE THAN 2 KHZ ON SPACE TONE
AND THE BANDWIDTH OCCUPIED BY THY MARKS AND SPACES SHALL BE
ABOUT 13.2 KHZ, WHICH WILL STAY WITHIN THE REALM OF THINE OWN
CHANNEL AND NOT CAUSE BUBONIC SIDEBANDS TO SPREAD OVER THE LAND!!!"

AND I SPAKE UNTO THE NEWCOMER SAYING, "HEAR OH NEWCOMER!"
GAZE UPON THE FACE OF THY WONDROUS SPECTROUS ANALYZER AND
SEE THE TUBE THEREIN, AND JUDGE YE THE MAGNIUDE OF THY
SINS!! SEE WHEREIN AND WHEREFORE THOU CREATETH A FESTERING
AND A CANKERING UPON THE CHANNELS OF THY BAND AND UPON THE
BAND OF THY BROTHERS!!"

AND INVOKING THE ORACLE ONCE AGAIN, I RAISED MY HAND AND THERE
CAME A VISION UPON THE TUBE OF HIS SPECTROUS ANALYZER WHICH
DID APPEAR THUS AS IS SHOWN FOR 40-COLUMN DISPLAYS----



WHEREIN FC IS THE CARRIER FREQUENCY
FM IS THE MODULATING FREQUENCY

"LO THE RESULT THEREFROM IS THAT THOU TAKETH UP BUNCHA DUPA
MORE SPACE OF OUR HOLY SPECTRUM THAN THOU THINKETH, OH MENTAL
MIDGET! THOU HAST THE WIT OF A FENCE POST, THE INTELLECT OF A
HOCKEY PUCK!!"

AND THESE THINGS WHICH I COMMAND THEE THIS DAY SHALL BE FOR
A SIGN UNTO THEE, FOR THEY ARE WRITTEN DOWN IN THE FUNCTIONS
OF BESSEL, FROM WHICH THERE IS NO ESCAPE. YEAH, VERILY, WE ARE
ALL SLAVES TO THE RULE OF CARSON AND THE FUNCTIONS OF BESSEL,
AND WOE BE UNTO THSE WHO FLAUNT THEIR MIGHT AND RISK THEIR
WRATH.

AND THEREUPON I SPAKE ONCE MORE UNTO THE NEWCOMER SAYING,
"AND REMEMBER THIS- THERE IS SIGNIFICANT SIDEBAND ENERGY
AS LONG AS THE SIDEBANDS ARE STRONGER THAT 26 DB BELOW THE
UNMODULATED CARRIER, SAYETH THE FCC! HARK! THEY ARE THE HOLY
ONES, KEEPERS OF THE TICKETS AND GIVERS OF THE LAW. DO NOT ANGER
THEM, FOR THEY WILL SMITE THEE AND CAUSE THEE GRIEVOUS WOUNDS.
AND SHOULD THE FEDS IGNORE THEE, THEN THY BRETHREN ON THE CHANNELS
WILL SEEK THEE OUT AND CAST THEE INTO THE WILDERNESS FROM WHENCE
THEE CAME!!!"

"HEAR, OH NEWCOMER!! CLEANSE THY ACT AND GET THEE TO A DEVIATION
METER!! AND BE COOL FOR ALL TIMES."

AND THUS ENDS THE PARABLE OF THE MARKS AND THE SPACES AND THE
ETERNAL TRUTS OF THE RULE OF CARSON. LET THESE WORDS
BE UNTO YOU FOR A LESSON.

GIVEN UNDER MY HAND AND SEAL ON THIS THIRTEENTH DAY IN
THE MONTH OF DECEMBER IN THE YEAR OF OUR LORD 1983
ON THE ISLAND OF LONG---
BY W2JUP, THE PATRIARCH OF FARMINGVILLE.

.PA CIRCUIT FEATURES

Recently Th Amateu Radi Researc an Developmen Corporatio (AMRAD) originator o th no popula AX.2 packe radi protocol develope retrofi boar fo th Vancouve Termina Nod Controlle board originall develope b Dougla Lockhart VE7APU Usin th daughte boar (par numbe VDS-1) system designer ar no free fro th memor constraint o th origina board Thi translate int bette operatio fo th Vancouver TNC packe radi enthusiast.

Som o th advantage o th AMRA Vancouve Daughte boar system are:

* No modifications (jumpers or traces cut) required on the Vancouver board for normal operation

* No jumper wires to hook between the two boards. All connections necessary are done via wire-wrap sockets.

* From 8k (using 2716's) to 32k (using 2764's) of EPROM

* From 8k (using 6116's) to 32k (using 8k by 8 chips) of RAM

* Software programmable baud rate generator (using Intel 8253)

   Optiona us o time interrupt fo bette softwar control
   (requires cutting two traces on the TNC board)

* Position for up to six 16-pin sockets for user kludging

* Position for one 24-pin socket for user kludging

* General kludge area of 11 by 17 tenth-inch spaced holes

* Uses only two additional IC's (other than RAM and EPROM)

* requires no additional power supplies (in fact the minus
   five volt supply needed for the 2708's can be eliminated)

* Full documentation available.

* Priced inexpensively at only $25.00 for the bare board.
   (which is a Mil-Spec quality board)

To order a VDS-1 board, send $25.00 Plus $2.25 for shipping
(US funds) to:

Technetronics Systems Inc.
ATTN: Charles O. Phillips

VANCOUVER TNC BOARD CHANGES

I i no necessar t mak an change t th Vancouve TN board unless one or more of the following is true:

1. Use of timed interrupts from the 8253 are planned.

2. Th VADC TN boar wa originall assemble usin I socket wit smal holes Sinc th VDS- interface t th VADC TN throug wire-wra socket plugge int fou ke socket (U1 U9 U11 an U18 o th TNC thes socket mus b capabl o acceptin th large pin tha wire-wra socket have I thi i no th case th offendin socket(s mus b replace wit one that will work before using the VDS-1.

Thes change t th VADC TN ar easil accomplishe i necessary an wil no affec th operatio o th TN wit o withou th VDS- installed.

1. Allowing Timed Interrupts From The VDS-1 8253.

Th Inte 825 time chi contain thre indepententl programmabl timers On o thes i use t provid softwar

contro o th packe channe bau rate Th othe tw ar
availabl t th programme t provid time interrupt t th
TNC Time i optionall wire t th non-maskabl Tra
interrup inpu pi o th 808 CPU whil time i optionall
wire t th maskabl INT interrup pi o th 808 CPU.

     Unfortunately th VADC TN ha bot o thes pin shorte
directl t groun (i additio t havin pull-dow resistors)
I orde t us thes input t th CPU the mus firs b
disconnecte fro ground Thi i accomplishe b cuttin tw
trace o th TN board.

     Th trac tha mus b cu t allo th Tra interrup i
locate o th botto o th TN board nea pi o th 808
CP (U1) Se Figur 1 Cu 1 fo th exac locatio t plac
th cut.

     Figur als show th positio o th trac tha mus b
cu t allo th INT t b used I i locate b pi 1 o U2
the 8255 Parallel Port IC. Cut the board as shown by Cut 2.
.pa   VANCOUVER TNC BOARD CHANGES (CONTINUED)

2. TNC Socket Changes

     A previousl mentioned certai socket (U1 U9 U11 an
U1)o th TN boar MUS b abl t accep th large pin use
o wire-wra I sockets

     I an o th socket won' accep th wire-wra socke
pins chang th socke i question Thi ca b lo easie
than it sounds, using the following technique.

STEP 1 Remove the IC in the socket to be changed.

STEP 2 Tur th boar ove (componen sid down) an locat th
socke i question Usin solde-sucke (o solde
wick an low-wattag solderin iron carefull remov
a muc o th solde a possibl o eac pin Th mor
solde remove o eac pin th better bu don' spen
lo o tim o eac pin o th trac ma com loos fro
th board Afte al th pin hav bee hi once loo
ove eac pin an tr onc agai t remov an remainin
solder A thi point yo shoul b abl t se throug
th hole a leas mos o th socket pins.

STEP 3 Usin smal pai o needle-nos pliers hea eac pi
wit th solderin iron an wiggl tha pi wit th
pliers Kee wigglin th pi a yo remov th
solderin iro an th pi cool down I th solde wa
sufficientl remove i th las step th pi shoul
sta loos i th hol afte th pi cool down D thi
wit eac pi o th socket Don' worr i al th pin
don' becom loos a first a lon a mos are.

STEP 4 Tur th TN boar over Carefull pr ver smal blade screwdrive betwee th P boar an th I socket B carefu no t scratc th boar whil doin this Remember th socke yo ar removin i t b throw away s scratc i i necessar rathe tha th TN board Whil pryin th socke awa fro th board hea u an socke pin tha ma stil b soldere t th board B alternatin th hea betwee an pin tha ar stil soldere an carefull pryin wit th screwdriver the socket should be walked out of the PC board holes.

STEP 5 Onc th socke ha bee removed g ove th hole o th TN P boar wit solde wic t remov an solde left behind.

STEP 6 Plac th ne socke o th TN board an solde i i place Chec th ne socke t b sur ther ar n solde bridges I i goo practic t re-instal th remove I i th ne socke an chec th TN fo prope operatio befor installin th VDS-1.
.pa   VDS-1 BOARD ASSEMBLY

     Us th followin step-by-ste instruction t properl assembl th VDS- daughte board Plac chec mar besid each step as it is completed.

     I orde t us th wire-wra socket a jumper betwee th tw boards th hole o th daughte boar wer mad large tha normal Thi ma mak i harde t solde th socket ont th board Mak sur tha wheneve solderin socket t th daughte boar ther i sufficien solde betwee th P eyele an th socke pin Th us o small pointe ti o you solderin iro wil help.

1. Plac fou 2 pi solder-tai socket i th RA position (U34 U35 U36 an U37) Solde pin an 1 o eac socke t hol i i place Whe al fou socket ar i place solde th remainin pin o th fou sockets Chec for solder bridges and cold solder joints.

2. Pu th followin solder-tai socket i thei position o th boar an solde the i place:

A) 16 pin socket at U38.

B) 16 pin socket at U39.

C) 14 pin socket at U40.

D) 14 pin socket at U42.

E) 24 pin socket at U41.

3. Instal eithe fou 2 pi solder-tai sockets o fou 2
pi Zer Insertio Forc (ZIF socket a th fou EPRO
locations U30 U31 U32 an U33 Solde pin an 1 o
eac socke first t hol th socke i place The solde
the remaining pins. Check for solder bridges.
.pa   VDS-1 BOARD ASSEMBLY (CONTINUED)

NOTE: Whe installin th wire-wra socket i th nex steps
b sur the ar mounte flus t th board an th pin
ar no crooked I th socket ar no soldere dow
flus t th board th pin wil b crooked causin
alignmen problem durin boar installation.

4. Instal 4 pi wire-wra socke a U1 Notic tha pi
i i th opposit directio a th res o th socket o
th board Carefull solde th wire-wra socke t th
daughter board, making sure there are no solder bridges.

5. Instal 2 pi wire-wra socke a U18 Carefull solde
i t th daughte board makin sur ther ar n solde
bridges Plac piec o tap ove th socket sinc n I
will be installed in this socket.

6. Plac 1 pi wire-wra socke a U9 Not th placemen o
pi 1 Solde al pin ont th daughte board.

7. Instal 1 pi wire-wra socke a U11 notin th
placemen o pi 1 Solde th socke t th board checkin
fo solde bridges Plac piec o tap ove thi socket
since there will be no IC installed in it.

8. Instal th 4 uF 1 vol electrolyti capacito a positio
C (nex t U18 (th valu o thi componen i ver non-
critical) Solde th capacito t th board.

9. Instal th si . u bypas capacitor a C t C o th
board, and solder them in place.

10. Befor installin th VDS-1 mak sur th vol bu i no
shorte t groun a an poin b measurin th resistanc
betwee th vol bu an groun wit volt-ohm-meter I
shoul rea relativel lo a first the slowl ris t
hig resistanc leve (dependin o th valu o C1).

11. I th VDS- passe visua inspection procee t th nex
section of this manual (Installation and Checkout).
.pa   INSTALLATION AND CHECKOUT

     Thi sectio describe ho t instal th VDS- o th VADC
TN board B carefu no t ben an o th wire-wra pin ou
o alignment o th boar wil no fi a snugl a designed
A wit th VDS- assembl procedure chec of eac ste a i

is completed.

1. I th VDS- i t b altere fro it origina configuratio
a jumpe area JP-5 JP-6 JP-7 o th 8 RA device ar
t b used chec th Optio Setting sectio o thi manua
befor proceedin t th nex ste here Sinc thes jumpe
area ar "normalled o th bac o th VDS-1 th prese
jumpe trace mus b cu BEFOR th VDS- i installe ont
th TN board (except for JP-8).

2. Carefull remov th followin IC fro th VADC TN board
making sure they are not overly handled:

    A) U1, 8085, CPU chip.

B) U7, 74LS00, quad nand gate (part of memory decoding).

C) U8, 74LS138, one-of-eight decoder (memory decoder).

D) U9, 74LS138, one-of-eight decoder (port decoder).

E) U11, CD4024, binary counter (baud rate generator).
        (be careful with this IC, as it is very sensitive).

F) U15 thru U18, 2708 EPROM memory.

G) U19 thru U26, 2114 RAM memory.

3. Carefull positio th daughte boar ove th mai TN
board makin sur no t ben an o th wire-wra socke
pins Lin u th wire-wra pi sockets startin wit U1
D no pres th pin dow int th socket o th TN boar
yet jus hol the gentl i th socke holes Th daughte
boar ha bee designe ver carefull t mak sur tha th
wire-wra pin lin u properly I ther i proble wit
pi alignment on o mor o th socket ma hav bee
soldere i slightl crooke (thi happene o th VDS-
prototype) I th pin don' alig properly eithe th
socke shoul b re-soldered o th pin ca b ben
slightl usin pai o needle-nos pliers.
.pa   INSTALLATION AND CHECKOUT (CONTINUED)

4.Afte U ha bee aligned chec U1 t se i th pin o
th opposit en o th VDS- ar als comin int prope
alignment I the are loo betwee th tw board an mak
sur U i als line u properly Lastly chec U1 a th
to o th boar fo prope pi alignment I ma b
necessar t mov th daughte boar aroun slightl t
accomplis prope alignmen o al pin o al sockets Tak
th extr tim t b sur al pin lin u withou havin t
stres eithe board a thi wil hel i th boar eve
need t b remove an re-installed.

5. Onc al th wire-wra pin lin u properl t th hole i
th socket o th VADC TN board plac th boar o
hard fla surfac an gentl pres o eac wire-wra socke
usin th followin sequenc unti yo fee th pin botto
ou i th TN sockes below

A) Pres th U socke dow first sinc th 4 pi socke
wil b th hardes t alig properly.

B) Next pres th U1 socke down makin sur th res o
th socket ar stil line u properly.

C) Now pres th U socke int it socke o th TN
board.

D) Lastly pres th U1 socke int it socke o th TN
board.

6. Mak sur a leas on o th switche o di switc S- o
th TN boar i ON I doesn' matte which a al th
necessar pin o th U1 socke ar shorte togethe o th
VDS-1.

7.Perfor on fina chec befor installin th IC o th
daughter board, looking over the following:

A) Mak sur al th wire-wra pin ar properl line u i
thei socke holes Mak sur non o th pin ar ben
int wron holes tw pin ar shorte together o
any of the pins are missin thir hole completely.

B) I i goo ide t tak fina readin o th
resistanc betwee th fiv vol buse an ground makin
sur ther ar n direc shorts I ther are remov
th VDS- fro th TNC an chec eac boar separatel
fo shorts.
.pa   INSTALLATION AND CHECKOUT (CONTINUED)

7. Install the following Integrated Circuits in their sockets:

A) 8085 CPU at U1.

B) 74LS138 port decoder at U9.

C) 74LS138 EPROM decoder at U38.

D) 74LS138 RAM decoder at U39.

E) CD4024 binary counter at U40.
        (Note that this chip seems very sensitive to static)

F) 8253 timer at U41.

G) RAM memory chips (minimum of 2) at U34 to U37.
        (minimum 2k parts RAM are U34 at RAM0, U35 at RAM1)

H) EPROM's as necessary in sockets U30 through U33.
        (U30 is ROM0, address 0000H)

I) D NO INSTAL U4 A THI TIME I i use onl fo
timed-interrupts an shoul b lef of durin initia
board checkout.

8. I shoul b note tha sinc th memor addres ha bee
altere t allo expande EPRO an RAM an sinc th packe
channe bau rat i no controlle wit softwar rathe tha
S-2 ne sofwar mus b use wheneve usin th VDS-1
Detail o softwar alteration t suppor th VDS- ar
provided in the Software Support section of this manual.

I i goo ide t us monito progra t tes th TN
syste afte installin th VDS-1 Thi way an problem
wit packe radi cod no functionin properl ca b trace
t software rathe tha hardware Ther ar differen
monito program availabl fo th TN baord I yo canno
obtai on fro loca packe enthusiast contac AMRA fo
softwar suppor (eithe 808 typ assembl languag file
unde CP/M o burne EPROMs) Not tha sinc AMRA i
voluntar organization EPROM ma no b immediatel
availabl (i othe words expec th possibilit o sligh
delay)
.pa   INSTALLATION AND CHECKOUT (CONTINUED)

Wheneve requestin EPRO suppor fro AMRAD b sur t
includ al necessar informatio suc as:

A) Station Callsign, including SSID.

B) Repeate Callsign (includin SSID's o an repeater t
be used as a default condition during power-up.

C) Ar repeater ar t b defaulte o o of a powe up.

D) Termina configuration Thi include termina speed
parit on/off parit type numbe o sto bits an i
thi TN i t b use a termina o hos computer
Norma operatio i 120 baud n parity on sto bit
and no repeaters.

E) Defaul packe channe bau rat a powe on Thi i
normally set to 1200 baud.

9. Appl powe t th TN board I al goe properly sign-
o messag shoul appea o th terminal I i does
instal th EPROM containin th packe radi code an tr
the out I the functio properly you TN boar i onc

agai read t snatc frame fro th air Tr monitorin a
activ packe channe fo while an connec t someon t
b sur tha al o th packe function ar workin
properly.

10. I yo boar doe no operat properly usin eithe th
monito progra o th packe code se th Troubleshootin
and Theory of Operation sections of this manual.

11. I timed-interrupt ar t b used instal U4 (74LS00) an
apply power. Check for proper interrupt operation.
.pa   Option Settings

     Th VDS- daughte boar i designe t b flexibl i th
typ an amoun o RA an EPRO i wil support I wil als
allo th timed-interrupt an packe channe bau rat t b
programme unde softwar control Ther ar severa jumpe
area provide o th boar fo alteratio o th standar
configuration Eac o thes options thei associate jumpe
locations, and default settings will be discussed here.

EPROM TYPE   DEFAULT TYPE 2732

     Th VDS- i designe t us 2716 2732 o 276 typ
EPROMs T alte th VDS- fro th defaul 273 type jumpe
JP-5 must be changed. Use the following steps to alter JP-5:

1. Tur th VDS- boar ove an locat JP- (nex t th
74LS13 EPRO decoder U38) Notic tha ther ar P trace
betwee severa pin o JP- tha ar slightl thinne tha
mos o th other i tha are o th board Usin a Xact
knife carefull cu th followin trace betwee th tw
pin of JP-5 as listed:

A) Cut trace between JP-5 pins 1 and 14.

B) Cut trace between JP-5 pins 2 and 13.

C) Cut trace between JP-5 pins 3 and 12.

D) Cut trace between JP-5 pins 4 and 11.

Instal 1 pi solder-tai socke a JP- an solde i i
place.

Configur 1 pi DI heade fo th prope typ o EPRO
memory chips as follows:

A) 2716 type EPROMs. Wire the following pins together:

Pin 4 to pin 14 (Address line A11 to U38 address A0).
Pin 1 to pin 13 (Address line A12 to U38 address A1).
Pin 2 to pin 12 (Address line A13 to U38 address A2).

Pi 1 t pi 11 (+ volt t 271 pi 23).

B) 2732 type EPROMs. Wire the following pins together:

Pin 1 to pin 14 (Address line A12 to U38 address A0).
Pin 2 to pin 13 (Address line A13 to U38 address A1).
Pin 3 to pin 12 (Address line A14 to U38 address A2).
Pin 4 to pin 11 (Address line A11 to 2732 A11).
.pa OPTION SETTINGS (CONTINUED)

C) 2764 type EPROMs. Wire the following pins together:

Pin 2 to pin 14 (Address line A13 to U38 address A0).
Pin 3 to pin 13 (Address line A14 to U38 address A1).
Pin 5 to pin 12 (Address line A15 to U38 address A2).
Pin 4 to pin 11 (Address line A11 to 2764 A11).

Instal th DI heade i th socke locate a JP-5 Th
resulting memory maps are as follows:

A) 2716 EPROM memory map:

0000H-07FFH	U30 (EPROM 0).
0800H-0FFFH	U31 (EPROM 1).
1000H-17FFH	U32 (EPROM 2).
1800H-1FFFH	U33 (EPROM 3).

B) Default 2732 EPROM memory map:

0000H-0FFFH	U30 (EPROM 0).
1000H-1FFFH	U31 (EPROM 1).
2000H-2FFFH	U32 (EPROM 2).
3000H-3FFFH	U33 (EPROM 3).

C) 2764 EPROM memory map:

0000H-1FFFH	U30 (EPROM 0).
2000H-3FFFH	U31 (EPROM 1).
4000H-5FFFH	U32 (EPROM 2).
6000H-7FFFH	U33 (EPROM 3).

RAM TYPE DEFAULT: 6116 TYPE

I th RA memor chip use ar t b change fro th
default 6116 type devices, use the following procedure:

1. Tur th VDS- boar ove t th botto o th boar
(COPYRIGH 198 notice an locat JP- (nex t U39)
Locate and cut the following traces at JP-6:

A) Cut trace between JP-6 pins 1 and 14.

B) Cut trace between JP-6 pins 2 and 13.

C) Cut trace between JP-6 pins 3 and 12.

D) Cut trace between JP-6 pins 6 and 9.
.pa OPTION SETTINGS (CONTINUED)

2. Instal 1 pi solder-tai socke a locatio JP-6 an
solder it in place.

3. Wir DI heade fo th typ o RA memor t b use
according to the following:

A) If 6116 type (2k by 8) devices are being used:

1) Wire pin 1 to pin 14 (Address line A11 to U39 A0).

2) Wire pin 2 to pin 13 (Address line A12 to U39 A1).

3) Wire pin 3 to pin 12 (Address line A13 to U39 A2).

4) Wire pin 6 to pin 9 (WR* to 6116 WR* pin).

B) If 6264 or 2186 RAM chips (8k by 8) are being used:

1) Wire pin 3 to pin 14 (Address line A13 to U39 A0).

2) Wire pin 4 to pin 13 (Address line A14 to U39 A1).

3) Wire pin 5 to pin 12 (Address line A15 to U39 A2).

4) Wire pin 1 to pin 9 (Address line A11 to RAM A11).

4. Place the appropriate DIP header into the socket at JP-6.

5. I 218 RA chip ar bein used als instal jumper a
location JP-9 JP-10 JP-11 an JP-1 o th BOTTO o th
VDS- board Th 218 typ RA chip ar actuall psuedo-
stati devices whic ma requir synchronizatio wit th
808 CPU Thes jumper hoo th 218 read line t th
808 read pin allowin memor synchronization.

6. The resulting memory map for the RAM memory is:

A) For 6116 type (2k by 8) devices:

8000H-87FFH	U34	(RAM 0)
8800H-8FFFH	U35	(RAM 1)
9000H-97FFH	U36	(RAM 2)
9800H-9FFFH	U37	(RAM 3)

B) For 6264 and 2186 type (8k by 8) devices:

8000H-9FFFH U34   (RAM 0)
A000H-BFFFH U35   (RAM 1)
C000H-DFFFH U36   (RAM 2)
E000H-FFFFH U37   (RAM 3)

TIMER OPTIONS

Ther ar thre independent softwar programmabl timer i th 825 time IC Th onl time tha mus b use i suppor o th VDS- daughte boar i time 0 whic i use t generat th bau rat o th packe channel Fo prope operation th 825 inpu cloc canno excee MHz Unfortunately th Vancouve TN maste cloc frequenc i 2.457 MHz Thi mean th maste cloc mus b divide befor sendin i t an o th cloc input o th 8253

I addition sinc th maximu diviso o sixtee bi counte i 65,53 an th inpu cloc woul no b 1.228 MHz th slowes resultin interrupt woul b abou 1 pe second wit n tri contro i tha rang (nex slowes woul b doubl that o 3 interrupts/sec.) Ther need t b bette wa o trimmin th numbe i interrupt pe second i timed-interrupt ar t b use effectively Thi i accomplishe wit U4 an JP-7.

Th output o U4 (CD4024 ar wire t pin 1 an thr o JP-7 Eac o thes pin i successiv divide-by-tw o th previou pin' frequency Th followin pin a JP- hav th accompanyin frequencies an ar normall jumpere t th followin inpu clock o U41:

Pin 1	1.2288 MHz (Baud Rate Generator input)
Pin 3	6144 KHz (Trap timer, INTR timer inputs)
Pin 4	3072 KHz
Pin 5	1536 KHz
Pin 6	768 KHz
Pin 7	384 KHz

Pi 1 o JP- i normall jumpere t th inpu cloc o time i U41 Thi provide a acceptabl cloc frequenc t time 0 whic i use a th bau rat generato fo th packe channel Othe output coul b use i necessary bu th nee fo thi i no anticipated.

Pi 1 o JP- i th inpu cloc t time o U41 Time optionall drive th Tra interrup inpu t th 808 CPU Th tra interrup i non-maskable s ther i n wa o disablin thes interrupt i th hardwar i enabled Usin th secon outpu o U4 usuall give enoug contro o th resulting interrupt rate.

Pi 1 o JP- i th inpu cloc t time 2 an i als normall wire t th secon outpu o U40 Time optionall drive th INT interrup inpu t th 808 CPU Th INT pi generate maskabl interrupt whic allow th softwar t selectivel disabl thi interrupt A wit th Tra interrup above th secon outpu o U4 usuall give enoug contro ove the frequency of INTR interrupts.

I an o th timin parameter se b JP- ar t b altered i i recommende tha socke b installe a JP-7 an DI header b use t chang th defaul values Thi i accomplished as follows:

1. Tur th VDS- boar ove an locat jumoe JP- (nex t th U4 socket) Carefull cu th followin traces:

A) Pin 1 to pin 14

B) Pin 2 to pin 13

C) Pin 2 to pin 12

2. Plac 1 pi solder-tai socke a JP-7 an solde i i place.

3. Wire a DIP header as necessary for the alterations requied.

4. Plac th DI heade i th socke a JP-7 an tes ou th changes.

TIMED INTERRUPT ENABLES

Th outpu o th tw timer tha ar capab o generatin interrupt ar normall disable by no installin U4 (74LS00) I time interrupt ar t b used U4 shoul b installed Jumpe JP- i use t selectivel enabl onl on o th othe o th time interrupts a necessary JP- i normall jumpere o fo bot interrupts othe configuration ca b mad b cutting the traces ot the TOP of the board at JP-8 as follows:

1. Cut trace between pins 1 and 4 to disable Trap interrupts.

2. Cut trace between pins 2 and 3 to disable INTR interrupts.

Thes trace wer place o th TO o th VDS- boar t allow easy access to them.

Kee i min tha th timer MUS b properl programme befor time interrupt ar enabled otherwis improper operatio wil result Not tha timer an shoul b programme fo puls operation rathe tha squar wave sinc th interrupt are level sensitive.

.pa THEORY OF OPERATION

I orde t bette understan ho th VDS- daughte boar interface wit th VADC TNC w wil firs delv int th VADC TN itself Sinc th origina manua supplie wit th VADC TN di no contai theor o operatio section w wil tr t fill in that gap to some degree here.

TNC HARDWARE OVERVIEW

Th VADC TN i actuall singl boar compute dedicate t changin dat betwee tw differen transmissio format (usuall asynchronou ASCI an HDL typ frames) Lik mos othe singl boar computers th TN ha Centra Processin Uni (CPU tha act a th brain o th computer EPRO memor tha contain th instruction fo th CPU RA memor t hol dat an contro informatio temporarily an som inpu an outpu (I/O device wit whic t communicat t th outsid world Se Figur 2 fo bloc diagra o th VADC TNC.

.pa THEORY OF OPERATION (CONTINUED)

CPU AND AND CPU SUPPORT CIRCUITRY

Th VADC TN boar use th Inte 808 CP chip Th 808 i a improve versio o th popula 8080 I i softwar compatibl wit th 8080 whic mean program writte fo th 808 wil usuall ru fin o a 8085

Th 808 CP ha built-i cloc generator O th VADC TN board 4.915 MH crysta i use t determin th cloc rate Thi frequenc wa probabl chose becaus i i multipl o mos o th standar bau rates Th interna oscillato divide thi frequenc i half resultin i a actua cloc rat o 2.457 MH (bot interna t th 808 an th res of the board).

Th 808 use multiplexe dat an lo hal addres bus Thi mean tha th dat an lowe portio o th addresse shar th sam se o pin o th 8085 I orde t accomplis this th 808 send specia signa out calle Addres Latc Enable o ALE wheneve addres informatio i o th AD0-AD lines O th TN board a eight-bi latc (U6 74LS373 i use t latc an hol th lo addres wheneve tol t b th AL pi fro th 8085.

Th 808 CP ha severa pin tha ca b use t directl contro th CP actions Som o thes ar th sam a th 8080 whil other ar ne t th 8085.

Th rese pi cause th CP t sto whateve i wa doing an immediatel g t th beginnin o memory Thi pi shoul b hooke t pushbutto typ switc s tha th operato ca

recover the board in case of a failure in program control.

Ther ar severa interrup pin o th 8085 Interrupt ar jus wha th nam implies i th associate pi i asserted th CP wil temporaril suspen whateve i i doing an d somethin els (whateve th interrup requested o th CP i programme t do) Som interrupt ar controllabl (maskable a t whethe th CP wil acknowledg an hono them whil other th CP ha n contro ove (non-maskable) i whic cas th CP MUS hono th interrupt Sinc ther ar severa differen interrupts an eac ma occu a an time eac on i assigne a orde o precedence Th interrupt o th TN baor wil b discusse i increasin orde o importance.

Th lowes priorit interrup i th INT pi o th 808 (pi 10) Thi pi i leve sensitive hig indicate reques fo interrupt I i maskable allowin th CP t ignor an INT requests I a INT interrup i allowe b th CPU th CP wil indicat thi b assertin th Interrup Acknowledg pi (INTA* low Th requestin devic ca the forc a instructio (usuall cal o restart ont th dat bus an th CP wil excut tha instruction Th VADC TN normall ha thi pi tie low disablin th INT function.

Th nex grou o interrupt ar th RS pins Thes pin hav highe priorit tha th INT pin ar maskabl b th CPU bu the operat slightl differently Whe on o th RS pin i asserted i cause th CP t g t specifi locatio i memory an execut instruction startin a tha locatio a i cal t tha locatio wa requested Th memor locatio called th typ o signa used th orde o priority an sourc o th reques o th TN boar ar show below.

Interrupt	Memory	Signal	Priority	Interrupt Source
RST 5.5	002CH	High	Low	User Interface
RST 6.5	0034H	High	Middle	U10 (8273) TxINT
RST 7.5	003CH	Pulse	High	U10 (8273) RxINT

Th highes priorit interrup o th 808 i th Tra interrup (pi 6) I i non-maskable an generate restar t memor locatio 0024H I i bot edg an leve sentitive Th TN boar ha thi pi tie low disablin th Tra interrupt.

Th 808 CP als generate som timin signal neede fo proper computer operation. These include:

IO/M* Low for memory request, high for input/output
RD* Low indicated a read function from memory or I/O
WR* Low indicates a write function to memory or I/O
RESET OUT High indicates the CPU is being reset.

Ther i als pi calle Ready whic i use t synchroniz CP operatio wit slowe memory Thi pi i no used on the original VADCG TNC board.

.pa THEORY OF OPERATION (CONTINUED)

TNC EPROM MEMORY

I orde fo th TN boar t functio properly th CP mus b tol wha t d b program Thi progra i hel i Erasable-Programmable-Read-Only-Memor (EPROM) Th TN use fou 270 typ EPRO chips eac o whic hold 102 byte o program fo tota o 409 byte (4k o progra memory

Ther i memor decode circui mad u o U (74LS00 an U (74LS138 tha determine wher i th CP memor th EPRO (an RAM sinc th sam decode i use fo both i t reside

Th memor ma fo a unmodifie TN boar is:

0000H-03FFH	U15 (EPROM 0)
0400H-07FFH	U16 (EPROM 1)
0800H-0BFFH	U17 (EPROM 2)
0C00H-0FFFH	U18 (EPROM 3)
1000H-13FFH	U19, U20 (RAM 0)
1400H-17FFH	U21, U22 (RAM 1)
1800H-1BFFH	U23, U24 (RAM 2)
1C00H-1FFFH	U25, U26 (RAM 3)
2000H-FFFFH	Unused, copies of above map

Th 74LS0 (U7 i use wit th addres decoder 74LS13 (U8) t decod memor read-onl cycle fo th EPROM an memor read/write cycles for the RAM memory.

Not tha th EPRO chip ar i th opposit sequenc tha on woul assume tha i EPRO i th right-most no th left-mos EPROM Th 270 EPROM requir +5V -5V an +12 t operate properly.

TNC RAM MEMORY

Fo th TN t functio properly i additio t EPRO memor t stor th program ther mus als b som amoun o temporar memor tha wil b use t stor th dat i need t process Th TN boar use 211 typ RA chips whic ar 102 b bits Tw o thes chip ar neede t stor complet bit wort o data Ther i roo fo fou bank o thes chips fo tota o 409 byte o dat storage Th RA memor share th sam memor decode circuitr wit th EPROM an i discussed above.

Sinc th 808 CP use bidirectiona dat bus th IN/OU pin o th 211 chip ar connecte directl t th CP dat

bus.
.pa THEORY OF OPERATION (CONTINUED)

TNC INPUT/OUTPUT

I orde fo th TN boar t function i mus ge dat fro th outsid worl t process an the sen th processe dat bac t th outsid worl whe done Thi functio i provide b th inpu an outpu device o th TN board Ther ar tw differen "channels fo dat t transfe betwee th TN an device connecte t it Th firs i th "use interface" an th secon i th lin o packe channel Eac on o thes channel i connecte t th TN CP throug specia ICs whic occup certai por location i th CP por addres space Eac o thes IC i als capabl o generatin interrupt t th CPU when it needs to be serviced.

Th I/ port use ar decode b U9 74LS138 I decode onl I/ por addresses whic ar mappe a follows:

00H-07H U3 8250 Serial I/O Port (User Interface)
08H-0FH U2 8255 Parallel I/O Port (User Interface-Optional)
10H-17H U10 8273 HDLC Protocol Main Ports (Packet Channel)
18H-1FH U10 8273 HDLC Protocol TX Data Port (Packet Channel)
20H-27H U10 8273 HDLC Protocol RX Data Port (Packet Channel)
28H-FFH Unused.

Th use interface t th VADC TN boar eithe throug seria (RS-23 o curren loop o paralle port Mos o th softwar suppor fo th VADC TN use onl th seria interfac option an the onl a ASCII RS-23 typ o seria interface I woul hav bee nic t hav bee abl t us bot th seria an paralle chip simultaneously bu sinc the shar quit fe o th sam DB-2 connecto pins thi i impractica withou cuttin severa traces an addin anothe connector.

Serial User Interface

Th seria use interfac use a 825 Asynchronou Communication Elemen (ACE) Thi chi ha bot UAR an bau rat generato buil int it I additio t seria dat line i an out i als provide som o th handshakin line typicall foun i a RS-23 interfac (DSR DTR RTS CTS DCD an RI) Th TN boar ha RS-23 drive chip o i t optionall mak thes signal eithe TT o RS-23 voltag levels Sinc th AC chi i complicate device severa I/ port ar assigne t i fo prope programmin an operation
.pa THEORY OF OPERATION (CONTINUED)

These ports are designated as follows:

Port 00 Transmit/Receive Data Buffer Registers.
Port 01 Interrupt Enable Register (Write Only).

Port 02   Interrupt Identification Register (Read Only).
Port 03   Line Control Register (UART Functions).
Port 04   Modem Control Register.
Port 05   Line Status Register (UART Status).
Port 06   Modem Status Register.
Port 07   Baud Rate Divisor Latch Registers.

Parallel User Interface

     Th paralle use interfac use a 825 Programmabl Periphera Interfac (PPI) Thi devic ha 2 line o paralle data eac o whic i programmabl t b eithe input o outputs I addition som o thes line becom handshakin line whe programme properly allowin ful 1 bi paralle Input/Output system with complete strobing and acknowledgements.

     Th 2 line o th 825 ar organize a thre group o line (group A B an C) wit thir grou (C bein furthe divide int tw 4-bi subgroups Th programmin o thi chi i beyon th scop o thi manual howeve th Por ma fo thi device on the TNC is as follows:

Port 08H Port A Data Bus.
Port 09H Port B Data Bus
Port 0AH Port C Data Bus.
Port 0BH PPI Control Port.
Ports 0CH-0FH will be in same as above.

     Sinc virtuall n on i usin th paralle use interface these locations are generally ignored.

Packet Channel Interface

     Th packe channe interfac i handle b a Inte 827 HDL Protoco Controlle chip Th 827 i ver complicate inside i tha i automaticall handle lo o th HDL protoco functions suc a cloc recovery NRZ encoding/decoding zer bi insertion/removal an frame-check-sequenc (CRC generation/checking Sinc th packe channe send HDL frame i synchronou mod (n star o sto bits onc thi chi start sendin fram o data i mus continu unti al th dat o tha fram i sent Ther ca b n startin an stoppin i th middl o sendin frame Thi mean th 827 mus b capabl o gettin th attentio o th TN CP quickl wheneve fram i bein sen o received
.pa   THEORY OF OPERATION (CONTINUED)

     Becaus o this th 827 use th highes interrupt o th TN board Th transmi an receiv dat register als us separat port tha th res o th 8273 Th por ma o th 827 is:

10H 8273 Main Command/Status Register.

11H 8273 Parameter/Result Register.
12H 8273 Reset/Tx Interrupt Result Register.
13H 8273 Rx Interrupt Result Register.
14H-17H Same registers as above.
18H-1FH 8273 Transmit Data Register.
20H-27H 8273 Receive Data Register.

Th 827 doe no hav a interna bau rat generator s a externa divide mus b used U11 CD402 seve stag binar counte i use t divid dow th 2.4576MH cloc t th frequencie necessar fo th 827 t work Th 827 ha digita phase-lock-loo (DPLL tha i use t recove th dat timin o th packe channel Thi DPL need X3 cloc t functio properly Th output o U1 ar sen t switc S2 Onl on o th switche o S shoul b o a an give time Th output o U1 provid fo bau rate fro 38,40 bau t 60 baud.

Th 827 provide mos o th primar signal use i a RS-23 interfac (TXD RXD CTS RTS an DCD) I addition ther ar tw eac use programmabl inpu an outpu pins Th VADC TN feed thes signal t 1 pi DI socke a J4 Th othe hal o J lead t th RS-23 leve converte ICs whic the lead to the packet channel DB-25, J2.

Daughter Board Theory

Th VDS- daughte boar wa designe t replac th memor o th Vancouve TN board I addition i provide softwar contro ove th packe channe bau rate an th optio o tim generate interrupts.

Th VDS- interface t th Vancouve TN throug fou wire-wra socket tha plu int ke socket o th TN board Th firs one i at th CP socket U1 Th 808 CP no plug int th wire-wra socke o th daughte board Usin thi socket severa o th ke signal t an fro th CP ca b easil obtaine.

Th nex socke tha plug int th TN i a U18 Thi use t b on o th 270 EPRO sockets Thi socke i use t recove th latche low-orde addres bu fro th latc (U6 o th Vancouve TNC I wa possibl t ad anothe latc o th daughte board bu tha woul hav increase loadin o th dat bu unnecessarily I addition pluggin int U1 provide structura suppor fo th VDS-1 Sinc th socke a U1 i used only as a jumper, there is not an IC that plugs into U18.

Th thir wire-wra socke betwee th tw board i a U9 th I/ por decoder Thi socke i use t ge th additiona por decode outpu fo th 825 time I a U41 U4 use port

28 t 2FH Th I tha wa plugge int U o th TN no plug into the daughter board U9 instead.

Th fourt wire-wra socke i a U11 Thi positio use t hav th CD402 bau rat generato plugge int it Sinc th bau rat i no generate b U41 ther i n I plugge int th U1 socke o th daughte board Not tha al th ol outpu pin o th CD402 ar no shorte together i doesn' matte whic switc a S i closed a lon a a leas on is.

VDS-1 EPROM Memory

Th VDS- boar ha fou socket fo EPRO use Th type o EPROM acceptabl b th VDS- ar 2716 2732 o 2764 Al fou EPROM mus b o th sam type ne EPRO addres decode i use o th daughte boar a U38 Th addres input t U3 com fro jumpe JP-5 JP- i pre-wire fo 273 typ EPRO decoding I EPROM othe tha 2732' ar t b used th trace o th bac o th VDS- mus b cu befor usin JP-5 See the Option Settings section for further details.

Not tha al thre type o EPROM usabl o th VDS- ru o +5 only s th othe tw voltage use b th 270 EPROM ar no neede fo EPRO use Th -5 i n longe neede a all s i ca b eliminated Th +12 i use b th RS-23 interfaces s i i stil needed Anothe advantag o gettin ri o th 2708' i tha th newe type o EPROM ru a higher speed, reducing the potential of timing problems.
.pa THEORY OF OPERATION (CONTINUED)

VDS-1 RAM Circuitry

separat RA memor decode (U39 74LS138 i no use o th VDS-1 Thi allow th RA chi siz t b differen tha th EPROM allowin greate syste flexibility Lik th EPRO decoder th RA decode addres input com fro jumpe (JP-6) Thi jumpe i pre-wire fo 611 typ devices Optionally 626 o 218 typ (8 b 8 device ca b used i JP- i altered Sinc th 218 i psuedo-stati devic (i i reall dynamic bu al suppor circuitr i insid th chip) i need t tel th CP wheneve i i no ready Thi i wh th jumper JP- thr JP-1 ar needed The allo th RA chip t tel th CP whe the ar no read yet an th CP add wai state unti th RA chip ar ready.

VDS-1 Timing Circuitry

On o th problem wit th origina Vancouve TN i tha th use mus chang switche t alte th bau rat o th packe channel I addition th slowes spee th TN boar run withou modificatio i 60 baud Thi i stil to fas fo H packe operatio a th moment Th VDS- remove thi proble b replacin th CD402 binar counte an S wit

programmabl time I (U41 a 8253) Th 825 ha thre separat programmabl timers on o whic i use t creat th cloc fo th 827 Protoco Controller Unfortunately th 825 ca onl handl inpu cloc speed u t MHz Th TN board' cloc i divide b tw b U4 o th daughte boar (th no famou CD4024 whic i the sen t th 825 time cloc input Th outpu o time i the sen t th wire-wra socket at U11, which feeds it to the TNC board.

secon outpu o th CD402 i use t driv th 825 inpu cloc fo timer an 2 Thes timer ar optionall use t driv th tra (non-maskable an INT (maskable interrup input t th 808 CPU Sinc th output o th timer ar activ low the mus b inverte befor sendin the t th CPU Thi inversio i accomplishe b U42 74LS00 Thi I wa lef ove fro th origina Vancouve TN memor decoder I time interrupt ar no bein used the shoul b disable b removing U42.

Jumpe JP- i provide t allo th use t alte th standar inpu cloc rate t th 825 timer I i no anticipate tha thes nee t b changed s JP- i normall not altered.

Not tha i timer o ar use t generat time interrupts the mus b programme fo shor duratio pulse sinc th TRA an INT interrupt ar leve sensitive an wil continue to interrupt as long as the inputs are high.

.pa TROUBLESHOOTING

Sinc th Vancouve TN i complet microcompute system i ca b ver difficul t correc problem tha ma arise I ther i problem us th followin step a guidelin t troubleshoo th TN system I i helpfu t hav anothe TN board available for comparing, and also for chip swapping.

Certai o th followin step ca b ignore i tha par o th boar seem t b functioning If fo example th boar work wit th terminal bu wil no transmi o receiv ove th packe channel th whol TN i no defective bu rathe jus th HDL controlle o it suppor circuitry Th followin step ar mor t hel whe th whol TN seem t b out-to-lunch.

Step 1. Overall Tests

A.Mak sur tha al chip o th TN ar positione properly Th TN boar ha severa chip i differen orientations s i i eas t pu chi i backwards Als mak sur tha non o th pin o th chip i ben unde rathe tha i th socke hole Thi ca b don b lookin carefull dow th en o eac socket I pi i ben under remov th chip, bend the pin back, and re-install the chip.

B.I th TN function properl unti i trie t transmit
the eithe send stead tone o continua flag (th
eterna fram syndrome) replac th CD4024 an tr again
Thi chi i EXTREMEL sensitiv t static an i th numbe
one cause of TNC malfunctions that AMRAD has encountered.

C. Chec th powe suppl lines bot wit mete AN scope
Thre termina regulator hav habi o goin int
oscillation, which won't show up on a meter.

D.Chec th TN syste wit monito RO tha i know t
work Sometime EPROM forge bi her o there causin
strange results.

E. Doubl chec th jumper o bot boards I i no
immediatel obviou wha th prope jumpe configuratio o
th Vancouve TN boar should be i al cases.

F.Remov th daughte boar an re-instal th IC remove fro
th TNC Tr bringin u th TN withou th daughte boar
t identif wher th proble is preferabl usin monito
progra i 270 an RA a 1000H-1FFFH I th TN
functions normally, proceed to step 3, VDS-1 Troubleshooting.

.pa   TROUBLESHOOTING (CONTINUED)

Step 2. Vancouver Board Troubleshooting

A. Appl powe t th TN board Usin scope chec pi 3 o
U fo 2.457 MH clock Th actua frequenc i no
importan a thi time a lon a i i nice clea squar
wave I not tr installin coupl 20p capacitor fro
U pin an t ground Sometime th 808 need thes
capacitor t functio properly I tha doesn' correc th
problem replac th 808 (U1) an the th crysta i stil
no clock.

B.Pus th Rese button A lon a th butto i hel down
U pi 3 shoul b low an U pi shoul b high Th
following should also be true as long as reset is held down:

1) Data lines (pins 12-19) should be high.
2) Address lines (pins 21-28) should be 1V. or less.
3) Pins 31, 32, and 35 should be held high.
4) Pins 30, 34, 6, and 10 should be low.
5) Pins 7, 8, and 9 should be low, depending on other chips.

C.Consul you schemati i on o thes pin i no a th
proper level, and look over the TNC board for shorts.

D. Releas th Rese button U pi 3 shoul no g high an
pi shoul g low Th followin shoul als b checke

(sinc th addres an dat buse ar no buffered thes
signal wil no b idealy shape pulses):

1) Data lines should have alternating high-low pulses.
2) Address lines should have alternating ihgh-low pulses.
3) Chec th outpu pin o th addres latc (U6 t mak
sure it is latching the low-half address properly.
4) Mak sur th pin 30 31 32 an 3 als hav pulse
whe the are supposed to.
5) Typ character o th consol (assumin seria inter
face an loo fo U pi (RST5.5 t g hig o eac
keystroke.

E.Chec fo active-lo transition o th chi selec pin o
a leas th lo EPRO (U1 pi 20) Ther shoul als b
intermitten transition o th RA chi selec lines
depending on the program being run.

F. I nothin obviou ha be foun a thi point usuall th
nex ste i t star swappin chip betwee functiona TN
an th defectiv board I al th chip hav bee changed
an th boar stil fail t operate i i tim t chec th
boar wit mete fo short o ba sockets
.pa   TROUBLESHOOTING (CONTINUED)

Step 3. Daughter Board Troubleshooting

     Not tha al pi number fo EPRO an RA chip mentione
belo (excep fo U18 ar assumin 2 pi sockets sinc tha i
wha th daughte boar i laye ou for Tak thi int accoun
when testing 24 pin devices in the 28 pin sockets.

A. Mos problem associate wit th daughte boar hav t d
wit th interconnection betwee i an th TN board Mak
sur onc agai tha al socket ar soldere properly an
that all the pins line up in the proper holes.

B.Remov U42 i installed Thi wil mak sur n spuriou
interrupt ar bein generate b th 825 timers U4
shoul b installe ONL i softwar i include t suppor
timed interrupts.

C.Mak sur tha al th jumper o th daughte boar ar
correc fo th typ o memor bein used Th VDS- i
normall jumpere fo 273 EPROMs an 611 RAMs Se th
Options Setting section for more information.

D. Follo throug D i Ste above Perfor th test firs
o th 808 itself the o th botto o th TN board' U
socke t mak sur al th signal ar makin i throug th
jumpers ok.

E.Chec U1 pin t t mak sur al bit o th low-orde

address bus are getting from the TNC to the daughter board.

F. Chec th outpu o th addres decoders A minimum U30
pi 2 (EPRO chi select shoul b periodicall pulsin
low I addition U3 pi 2 shoul als b pulsin low
depending on the software being used.

G. A wit th TN boar itself th easies metho t procee
a thi poin i t swa al IC o th daughte boar wit
on tha i functiona (i migh b goo t tr th othe
daughte boar first) I problem persist carefull g
over the daughter board for shorts of bad solder joints.

.pa   SOFTWARE SUPPORT

     Ther ar fe modification tha mus b mad t an
softwar befor runnin i o Vancouve TN wit th VDS-
installed Thes hav t d wit large EPRO space relocate
an large RAM softwar contro o th packe channe speed an
optionally timed interrupts.

EPROM SUPPORT

     Actually n change nee t b mad fo th EPRO spac
itself bu th additiona EPRO spac mean tha al RA
location equates need to be changed.

RAM SUPPORT

     Mos o th program writte fo th Vancouve TN us tw
equate fo th RAM on fo th beginnin an th othe en o
RA memory Al othe reference t RA memor location ar
mad base o thes tw equates Whe usin th VDS-1 al RA
start a locatio 8000H Usin fou 611 typ RA chips RA
wil en a 9FFFH Thi mean th tw equate ar no a
follows:

```
     LORAM     EQU  8000H     ; Start of RAM memory
     HIRAM     EQU  9FFFH     ; End of RAM memory
```

     I addition tw othe equate mus b change i th
LIPM.AS fil t mak i wor properly Th orde o thes
equates is now reversed, and they MUST be in this sequence:

```
     LBALEN    EQU  (HIRAM-LBA)/2  ; LENGTH OF LINE BUFFER AREA
     LBAEND    EQU  (LBA+LBALEN)   ; NEXT BYTE AFTER LINE BUFFER
```

TIMER SUPPORT

     Sinc th packe channe bau rat i no controlle b
software som softwar mus b provide t se th packe speed
I addition th time mus b initialize befor an spee ca
b selected Th mos rudimentar for o cod t d thes

functions at 1200 baud is as follows:

```
     CTR0      EQU  28H  ; COUNTER 0 PORT
     CTR1      EQU  29H  ; COUNTER 1 PORT
     CTR2      EQU  2AH  ; COUNTER 2 PORT
     CTRPRM    EQU  2BH  ; COUNTER PARAMETER PORT

CTRIN:    MVI  A,36H     ; CTR0, SQUARE WAVE, BINARY MODE
          OUT  CTRPRM    ; SEND IT TO THE PARAMETER PORT
          MVI  A,20H     ; LOW HALF DIVIDER FOR 1200 BAUD
          OUT  CTR0      ; SEND LOW HALF TO COUNTER 0
          MVI  A,0       ; HIGH HALF DIVIDER 0
          OUT  CTR0      ; AND SEND IT TO COUNTER 0
.pa                  SOFTWARE SUPPORT (CONTINUED)
```

Th followin i som informatio o programmin th 825 chip I i give i assembl forma t ai i installin i i software.

```
     CNTR02    EQU  80H  ; SELECT COUNTER 2 FOR PROGRAMMING
     CNTR01    EQU  40H  ; SELECT COUNTER 1 FOR PROGRAMMING
     CNTR00    EQU  00H  ; SELECT COUNTER 0 FOR PROGRAMMING
     RDLDBH    EQU  30H  ; READ/LOAD LOW BYTE FIRST, THEN HIGH
                         ; OF DIVIDER IN COUNTER SPECIFIED
     RDLDHI    EQU  20H  ; READ/LOAD HIGH BYTE ONLY OF DIVIDER
     RDLDLO    EQU  10H  ; READ/LOAD LOW BYTE ONLY OF DIVIDER
     CNTLAT    EQU  00H  ; LATCH THE COUNTER AT PRESENT COUNT
     MODE05    EQU  0AH  ; MODE 5 (HWARE TRIGGERED STROBE)
     MODE04    EQU  08H  ; MODE 4 (SWARE TRIGGERED STROBE)
     MODE03    EQU  06H  ; MODE 3 (SQUARE WAVE GENERATOR)
     MODE02    EQU  04H  ; MODE 2 (PULSE RATE GENERATOR)
     MODE01    EQU  02H  ; MODE 1 (PROGRAMMABLE ONE-SHOT)
     MODE00    EQU  00H  ; MODE 0 (INTERRUPT ON TERMINAL CNT)
     BCDCNT    EQU  01H  ; BCD COUNTER MODE (4 DECADES)
     BINCNT    EQU  00H  ; BINARY MODE (16 BITS).
```

I shoul b note tha eac counte i programme vi th contro port an tha th actua counte port ar use onl fo loading or reading the count of the timer.

Consul th Inte 825 dat sheet fo mor informatio o programming the 8253.

Th nex tabl contain th BINAR divide t loa int th 8253 timer 0 for most common baud rates.

SPEED	Low Half Divider	High Half Divider
9600	04H	00
4800	08H	00

```
     !   2400      !         10H       !         00        !
     !   1200      !         20H       !         00        !

I don't understand; FCC only changes a call if you request it these
days. In the old days they only changed your district if you moved
your primary station license. An up to date mailing address and a
secondary station in portable operation would keep your call.

I've only been at it about ten years, but mostly in New England, in
two license classes, in ten locations, with the same call always.
What's confusing? A call sign should say something about the
licensee? (de WA2YBA/1).

There's a newsletter out that was originally devoted to the R-390, and which has recently expanded to cover all varieties of tube receivers. It is now named "The Hollow State Newsletter" (as opposed to solid-state, of course). I don't have the address handy, but it was in a recent issue of Review of International Broadcasting. I'll post it as soon as I find it.

Will

I have had a Yaesu FT-290R multimode portable 2-meter rig for 2yrs now and am still thoroughly pleased with it!

Don't like-
1) Does not remember repeater offset.

Do like-
1) Fully self contained, I use it mobile from the cigarette lighter, base from a power supply, and portable with the 8 self contained C cells.

2) One knob memory channel select for quick mobile QSY

3) Backlit LCD display- superior to LED's in sunlight and lower in power consumption when portable.

4) multimode capability

Thanks to Mike, K6ICS for this information.

There are actually TWO RM's (Rulemaking petitions) involved. The first
is RM 4829, "Reassignment of 220-225 MHz to Land Mobile", and the second
is RM 4831, "Reassignment of 216-222 Mhz for Sideband Technology
Development". I do not have copies yet of the two RMs, but will get
them ASAP. However, from what I've seen in the trade press, I believe
the LMCC (the Land Mobile industry trade group) is behind these. Their
demands don't stop at 220 mhz; they also want the 900 mhz "reserve" bands
which are already being requested by land mobile satellite developers,
along with more UHF TV channels.

My personal feeling is that the best place to get spectrum for land mobile
IS UHF TV -- at least we agree there. Even in large metropolitan areas,
most of the spectrum is idle. With the enormous success of cable TV,
MDS and video recorders, the demand for commercial TV broadcast spectrum
is (or should be) much reduced.

I suspect that if we all sing the same tune ("Get it from the broadcasters!")
then we might get the message across. Even if they got the whole 220 mhz
band, that's still less than ONE television channel, and there are a lot
of 'em above 470 mhz...

73, Phil

The following item was forwarded from the CompuServe HamNet SIG
bulletin board. I thought it might be of interest to the net,
especially in light of the 220 MHz controversy.

     73,
     ---Bob/N3CVL

 #: 22496   Sec. 9 - Packet/RTTY/AMTOR
Sb: Coordination changes
    03-Aug-84 20:15:15
Fm: NORM W2JUP 74055,140
To: ALL

On 8/1/84, the Board of Directors of TSARC, the Tri-State Amateur Repeater
Council, meeting in Executive session, took the unprecedented step of
reversing its original position on the coordination of non-traditional modes
such as packet radio, RBBS and MSO systems and simplex auto-patches. TSARC had
originally decided that such operations, because of their simplex,
single-emitter concepts, did not really relate to the coordination philosophy
already in place for repeaters using the classic two-channel input/output
frequency structures and principles, and that consideration of requests for
coordination would have been inappropriate.

After much discussion and deliberation, the Board voted to give full
consideration to the coordination of such simplex operations as packet radio,
radio bulletin board systems (RBBS), message storage operations (MSOs),
mailbox systems, and legitimate simplex autopatches, and resolved to:

1. Establish the concept of the coordination of certain specific
    VHF and UHF channels based on the mode of operation, as well as
    geographical area and physical separation considerations;

2. Recognize, acknowledge and support the use of the frequency
    145.010 as a de facto East Coast standard, and to formally
    recommend that 145.010 be reserved for exclusive use by stations
    operating packet radio systems;

3. Recognize the requirements for a special wide-band channel
    coordination and allocation in the 220 MHz band, and establish
    and coordinate a single 100-KHz wide channel from 220.500 to
    220.600 MHz for exclusive use by packet radio systems, possibly

for 56 kbit/s packet radio trunk and backbone services.

This last item was given exceptional urgent emphasis and attention in view of the recent public statements by Robert Foosaner, Chief of the FCC's Private Radio Branch. In his speech at the FCC Forum at the recent ARRL National Convention in New York City, Mr. Foosaner clearly outlined the need for allocations of additional new channels in the Land Mobile Service, and that the Commission would be looking at all parts of the spectrum for suitable frequencies, including the possible re-assignment of some portions of the amateur radio band at 220 MHz. The Board noted that certain commercial interests had already filed formal petitions asking specifically that the Commission re-assign the frequencies 216 to 222 MHz to the Land Mobile Service.

It was the Board's very strong feeling that the coordination of the 100-KHz channel 220.500 to 220.600 MHZ would conform to the requests and needs of amateur operators working in the most sophisticated technologies, and clearly demonstrate to the Commission that the Amateur Service's most advanced technologies were finding a home in the lower portion of the 220 MHz band, establishing maximum visibility and credibility, something that has not been noteworthy in past years on 220.

The Board also established a requirement for the re-evaluation, and revision of existing TSARC recommended technical operating standards, including immediate efforts to study and incorporate new technical operating information appropriate to the packet radio, RBBS/MSO and other non-voice operating modes. TSARC welcomes and encourages input, comment and suggestions from other coordinating councils in these matters. Comments of a technical nature can be mailed to:

Here is the info on the Hollow State Newsletter, from the February '84
issue of Review of International Broadcasting, pg 11:

HOLLOW STATE NEWSLETTER is new name for R390 Newsletter, reflecting its
expansion to cover technical information about all tube-type receivers,
the R390 having been pretty well exhausted in first three issues. Covers
modifications, where to get parts, anecdotes, etc. $4 for one year/ four
issues. At least four back issues available for $1 each. Subscription
address: Chris Hansen, PO Box 1226, New York, NY 10159

(Editorial address: Skip Arey, PO Box 421, Mount Holly, NJ 08060)

This ought to be of use to anyone with a tube-type receiver. I intend to
subscribe and order all the back issues, myself. Now if I would just
get around to doing it...

State Scanner Law Exemptions for Hams

In a new one page summary sheet of state scanner laws published by SCAN, the following states accord radio amateurs exemptions from scanner prohibition laws:

Florida, Indiana, Michigan, New Jersey (Tech Class or higher), New York

There are, however, several states that do not include any exclusion for radio amateurs.

This chart is available for $1 by writing:

SCAN Scanner Laws
240 Fencl Lane
Hillside, IL 60162

The July/August 1984 issue of SCAN Magazine contains a more detailed article, "Mobile Scanner Laws", by C. Keith Pettigrew, Attorney at Law. This article contains statute/state code numbers for several laws.

Does anyone have a good (reasonably accurate) program
for predicting propagation on HF?

Any language will do (BASIC, C, FORTRAN, Pascal).

Thanks in advance,
George

In reviewing the FCC regulations recently, I ran across the following
question:

> 97.403 (a) Definition of Space Operation.
> Space-to-earth and space-to-space, Amateur Radio communication
> from a station which is beyond, is intended to go beyond, or
> has been beyond the major portion of the earth's atmosphere.
>
> 97.407 Eligibility for space operation.
> Amateur Radio stations licensed to Amateur Extra Class operators
> are eligible for space operation (see 97.403(a)). The station
> licensee may permit any Amateur Radio operator to be the control
> operator, subject to the privileges of the control operator's
> class of license (see 97.7).

My 1983 Callbook lists W5LFL as an Advanced Class licensee. Did Owen
get a waver of 97.407 from the FCC, or am I missing something here?

WANTED TRANSMITTER

I am looking for a 227 KHZ <- note KHZ.. transmitter. It need be
but a few mili-watts at the most. need a range of about 20 feet.
Also it would be nice if it could be put into a small package
and be battery powered.

Drake R-4A receiver with manual less speaker - $175.00
Overall condition is very good, tubes fine, all standard crystals.

I purchased an R-4C/T-4XC and don't need it anymore.

For sale:

    ~1954 vintage Collins R-388 rack-mount general coverage
    shortwave receiver (military version of 51J3). Receives
    0.5-30.5 MHz in 30 bands, with 1 KHz dial precision. Still has
    original alignment tools and 51J3 instruction/service manual.
    Weighs about 40 lbs. Excellent condition. Serial number 227.

Price: $275 (negotiable). I will ship.

[vox open delay]

Packet radio lives in West Lafayette Indiana. With
wb9qpg, kf9a, and n9drr up and running and n9nc waiting
on kit delivery. For those of you close by, try 146.580 MHZ.

Do any of the TAPR core group have access to uucp/usenet?
Do they read this group?

Is anybody working on, or know who is working on defining
or implementing above the ISO link layer? Who can I contact
to offer some time/help?

Please mail your reply. I will repost if alot of interest is shown.

tnxs & 73 ... Steve, N9DRR

.PA CIRCUIT FEATURES

Recently Th Amateu Radi Researc an Developmen Corporatio (AMRAD) originator o th no popula AX.2 packe radi protocol develope retrofi boar fo th Vancouve Termina Nod Controlle board originall develope b Dougla Lockhart VE7APU Usin th daughte boar (par numbe VDS-1) system designer ar no free fro th memor constraint o th origina board Thi translate int bette operatio fo th Vancouver TNC packe radi enthusiast.

Som o th advantage o th AMRA Vancouve Daughte boar system are:

* No modifications (jumpers or traces cut) required on the Vancouver board for normal operation

* No jumper wires to hook between the two boards. All connections necessary are done via wire-wrap sockets.

* From 8k (using 2716's) to 32k (using 2764's) of EPROM

* From 8k (using 6116's) to 32k (using 8k by 8 chips) of RAM

* Software programmable baud rate generator (using Intel 8253)

  Optiona us o time interrupt fo bette softwar control
  (requires cutting two traces on the TNC board)

* Position for up to six 16-pin sockets for user kludging

* Position for one 24-pin socket for user kludging

* General kludge area of 11 by 17 tenth-inch spaced holes

* Uses only two additional IC's (other than RAM and EPROM)

* requires no additional power supplies (in fact the minus
  five volt supply needed for the 2708's can be eliminated)

* Full documentation available.

* Priced inexpensively at only $25.00 for the bare board.
  (which is a Mil-Spec quality board)

To order a VDS-1 board, send $25.00 Plus $2.25 for shipping
(US funds) to:

Technetronics Systems Inc.
ATTN: Charles O. Phillips
6134 Columbia Pike
Falls Church, VA 22041

.pa VANCOUVER TNC BOARD CHANGES

I i no necessar t mak an change t th Vancouve TN board unless one or more of the following is true:

1. Use of timed interrupts from the 8253 are planned.

2. Th VADC TN boar wa originall assemble usin I socket wit smal holes Sinc th VDS- interface t th VADC TN throug wire-wra socket plugge int fou ke socket (U1 U9 U11 an U18 o th TNC thes socket mus b capabl o acceptin th large pin tha wire-wra socket have I thi i no th case th offendin socket(s mus b replace wit one that will work before using the VDS-1.

Thes change t th VADC TN ar easil accomplishe i necessary an wil no affec th operatio o th TN wit o withou th VDS- installed.

1. Allowing Timed Interrupts From The VDS-1 8253.

Th Inte 825 time chi contain thre indepententl programmabl timers On o thes i use t provid softwar contro o th packe channe bau rate Th othe tw ar availabl t th programme t provid time interrupt t th TNC Time i optionall wire t th non-maskabl Tra interrup inpu pi o th 808 CPU whil time i optionall wire t th maskabl INT interrup pi o th 808 CPU.

Unfortunately th VADC TN ha bot o thes pin shorte directl t groun (i additio t havin pull-dow resistors) I orde t us thes input t th CPU the mus firs b disconnecte fro ground Thi i accomplishe b cuttin tw trace o th TN board.

Th trac tha mus b cu t allo th Tra interrup i locate o th botto o th TN board nea pi o th 808 CP (U1) Se Figur 1 Cu 1 fo th exac locatio t plac th cut.

Figur als show th positio o th trac tha mus b cu t allo th INT t b used I i locate b pi 1 o U2 the 8255 Parallel Port IC. Cut the board as shown by Cut 2.
.pa VANCOUVER TNC BOARD CHANGES (CONTINUED)

2. TNC Socket Changes

A previousl mentioned certai socket (U1 U9 U11 an U1)o th TN boar MUS b abl t accep th large pin use o wire-wra I sockets

I an o th socket won' accep th wire-wra socke pins chang th socke i question Thi ca b lo easie than it sounds, using the following technique.

STEP 1 Remove the IC in the socket to be changed.

STEP 2 Tur th boar ove (componen sid down) an locat th socke i question Usin solde-sucke (o solde wick an low-wattag solderin iron carefull remov a muc o th solde a possibl o eac pin Th mor solde remove o eac pin th better bu don' spen lo o tim o eac pin o th trac ma com loos fro th board Afte al th pin hav bee hi once loo ove eac pin an tr onc agai t remov an remainin solder A thi point yo shoul b abl t se throug th hole a leas mos o th socket pins.

STEP 3 Usin smal pai o needle-nos pliers hea eac pi wit th solderin iron an wiggl tha pi wit th pliers Kee wigglin th pi a yo remov th solderin iro an th pi cool down I th solde wa sufficientl remove i th las step th pi shoul sta loos i th hol afte th pi cool down D thi

wit eac pi o th socket Don' worr i al th pin
don' becom loos a first a lon a mos are.

STEP 4 Tur th TN boar over Carefull pr ver smal
blade screwdrive betwee th P boar an th I
socket B carefu no t scratc th boar whil doin
this Remember th socke yo ar removin i t b
throw away s scratc i i necessar rathe tha th
TN board Whil pryin th socke awa fro th board
hea u an socke pin tha ma stil b soldere t th
board B alternatin th hea betwee an pin tha ar
stil soldere an carefull pryin wit th screwdriver
the socket should be walked out of the PC board holes.

STEP 5 Onc th socke ha bee removed g ove th hole o
th TN P boar wit solde wic t remov an solde
left behind.

STEP 6 Plac th ne socke o th TN board an solde i i
place Chec th ne socke t b sur ther ar n
solde bridges I i goo practic t re-instal th
remove I i th ne socke an chec th TN fo prope
operatio befor installin th VDS-1.
.pa   VDS-1 BOARD ASSEMBLY

Us th followin step-by-ste instruction t properl
assembl th VDS- daughte board Plac chec mar besid
each step as it is completed.

I orde t us th wire-wra socket a jumper betwee th
tw boards th hole o th daughte boar wer mad large tha
normal Thi ma mak i harde t solde th socket ont th
board Mak sur tha wheneve solderin socket t th daughte
boar ther i sufficien solde betwee th P eyele an th
socke pin Th us o small pointe ti o you solderin
iro wil help.

1. Plac fou 2 pi solder-tai socket i th RA position
(U34 U35 U36 an U37) Solde pin an 1 o eac
socke t hol i i place Whe al fou socket ar i
place solde th remainin pin o th fou sockets Chec
for solder bridges and cold solder joints.

2. Pu th followin solder-tai socket i thei position o
th boar an solde the i place:

A) 16 pin socket at U38.

B) 16 pin socket at U39.

C) 14 pin socket at U40.

D) 14 pin socket at U42.

E) 24 pin socket at U41.

3. Instal eithe fou 2 pi solder-tai sockets o fou 2 pi Zer Insertio Forc (ZIF socket a th fou EPRO locations U30 U31 U32 an U33 Solde pin an 1 o eac socke first t hol th socke i place The solde the remaining pins. Check for solder bridges.

.pa

NOTE: Whe installin th wire-wra socket i th nex steps b sur the ar mounte flus t th board an th pin ar no crooked I th socket ar no soldere dow flus t th board th pin wil b crooked causin alignmen problem durin boar installation.

4. Instal 4 pi wire-wra socke a U1 Notic tha pi i i th opposit directio a th res o th socket o th board Carefull solde th wire-wra socke t th daughter board, making sure there are no solder bridges.

5. Instal 2 pi wire-wra socke a U18 Carefull solde i t th daughte board makin sur ther ar n solde bridges Plac piec o tap ove th socket sinc n I will be installed in this socket.

6. Plac 1 pi wire-wra socke a U9 Not th placemen o pi 1 Solde al pin ont th daughte board.

7. Instal 1 pi wire-wra socke a U11 notin th placemen o pi 1 Solde th socke t th board checkin fo solde bridges Plac piec o tap ove thi socket since there will be no IC installed in it.

8. Instal th 4 uF 1 vol electrolyti capacito a positio C (nex t U18 (th valu o thi componen i ver non-critical) Solde th capacito t th board.

9. Instal th si . u bypas capacitor a C t C o th board, and solder them in place.

10. Befor installin th VDS-1 mak sur th vol bu i no shorte t groun a an poin b measurin th resistanc betwee th vol bu an groun wit volt-ohm-meter I shoul rea relativel lo a first the slowl ris t hig resistanc leve (dependin o th valu o C1).

11. I th VDS- passe visua inspection procee t th nex section of this manual (Installation and Checkout).

locations, and default settings will be discussed here.

EPROM TYPE   DEFAULT TYPE 2732

     Th VDS- i designe t us 2716 2732 o 276 typ
EPROMs T alte th VDS- fro th defaul 273 type jumpe
JP-5 must be changed. Use the following steps to alter JP-5:

1. Tur th VDS- boar ove an locat JP- (nex t th
74LS13 EPRO decoder U38) Notic tha ther ar P trace
betwee severa pin o JP- tha ar slightl thinne tha
mos o th other i tha are o th board Usin a Xact
knife carefull cu th followin trace betwee th tw
pin of JP-5 as listed:

A) Cut trace between JP-5 pins 1 and 14.

B) Cut trace between JP-5 pins 2 and 13.

C) Cut trace between JP-5 pins 3 and 12.

D) Cut trace between JP-5 pins 4 and 11.

Instal 1 pi solder-tai socke a JP- an solde i i
place.

Configur 1 pi DI heade fo th prope typ o EPRO
memory chips as follows:

A) 2716 type EPROMs. Wire the following pins together:

Pin 4 to pin 14 (Address line A11 to U38 address A0).

Pin 1 to pin 13 (Address line A12 to U38 address A1).
Pin 2 to pin 12 (Address line A13 to U38 address A2).
Pi 1 t pi 11 (+ volt t 271 pi 23).

B) 2732 type EPROMs. Wire the following pins together:

Pin 1 to pin 14 (Address line A12 to U38 address A0).
Pin 2 to pin 13 (Address line A13 to U38 address A1).
Pin 3 to pin 12 (Address line A14 to U38 address A2).
Pin 4 to pin 11 (Address line A11 to 2732 A11).
.pa   OPTION SETTINGS (CONTINUED)

C) 2764 type EPROMs. Wire the following pins together:

Pin 2 to pin 14 (Address line A13 to U38 address A0).
Pin 3 to pin 13 (Address line A14 to U38 address A1).
Pin 5 to pin 12 (Address line A15 to U38 address A2).
Pin 4 to pin 11 (Address line A11 to 2764 A11).

Instal th DI heade i th socke locate a JP-5 Th
resulting memory maps are as follows:

A) 2716 EPROM memory map:

0000H-07FFH	U30 (EPROM 0).
0800H-0FFFH	U31 (EPROM 1).
1000H-17FFH	U32 (EPROM 2).
1800H-1FFFH	U33 (EPROM 3).

B) Default 2732 EPROM memory map:

0000H-0FFFH	U30 (EPROM 0).
1000H-1FFFH	U31 (EPROM 1).
2000H-2FFFH	U32 (EPROM 2).
3000H-3FFFH	U33 (EPROM 3).

C) 2764 EPROM memory map:

0000H-1FFFH	U30 (EPROM 0).
2000H-3FFFH	U31 (EPROM 1).
4000H-5FFFH	U32 (EPROM 2).
6000H-7FFFH	U33 (EPROM 3).

RAM TYPE   DEFAULT: 6116 TYPE

     I th RA memor chip use ar t b change fro th
default 6116 type devices, use the following procedure:

1. Tur th VDS- boar ove t th botto o th boar
(COPYRIGH 198 notice an locat JP- (nex t U39)
Locate and cut the following traces at JP-6:

A) Cut trace between JP-6 pins 1 and 14.

B) Cut trace between JP-6 pins 2 and 13.

C) Cut trace between JP-6 pins 3 and 12.

D) Cut trace between JP-6 pins 6 and 9.
.pa   OPTION SETTINGS (CONTINUED)

2. Instal 1 pi solder-tai socke a locatio JP-6 an
solder it in place.

3. Wir DI heade fo th typ o RA memor t b use
according to the following:

A) If 6116 type (2k by 8) devices are being used:

1) Wire pin 1 to pin 14 (Address line A11 to U39 A0).

2) Wire pin 2 to pin 13 (Address line A12 to U39 A1).

3) Wire pin 3 to pin 12 (Address line A13 to U39 A2).

4) Wire pin 6 to pin 9 (WR* to 6116 WR* pin).

B) If 6264 or 2186 RAM chips (8k by 8) are being used:

1) Wire pin 3 to pin 14 (Address line A13 to U39 A0).

2) Wire pin 4 to pin 13 (Address line A14 to U39 A1).

3) Wire pin 5 to pin 12 (Address line A15 to U39 A2).

4) Wire pin 1 to pin 9 (Address line A11 to RAM A11).

4. Place the appropriate DIP header into the socket at JP-6.

5. I 218 RA chip ar bein used als instal jumper a
location JP-9 JP-10 JP-11 an JP-1 o th BOTTO o th
VDS- board Th 218 typ RA chip ar actuall psuedo-
stati devices whic ma requir synchronizatio wit th
808 CPU Thes jumper hoo th 218 read line t th
808 read pin allowin memor synchronization.

6. The resulting memory map for the RAM memory is:

A) For 6116 type (2k by 8) devices:

8000H-87FFH	U34	(RAM 0)
8800H-8FFFH	U35	(RAM 1)
9000H-97FFH	U36	(RAM 2)
9800H-9FFFH	U37	(RAM 3)

B) For 6264 and 2186 type (8k by 8) devices:

8000H-9FFFH	U34	(RAM 0)
A000H-BFFFH	U35	(RAM 1)
C000H-DFFFH	U36	(RAM 2)
E000H-FFFFH	U37	(RAM 3)

TIMER OPTIONS

Ther ar thre independent softwar programmabl timer i th 825 time IC Th onl time tha mus b use i suppor o th VDS- daughte boar i time 0 whic i use t generat th bau rat o th packe channel Fo prope operation th 825 inpu cloc canno excee MHz Unfortunately th Vancouve TN maste cloc frequenc i 2.457 MHz Thi mean th maste cloc mus b divide befor sendin i t an o th cloc input o th 8253

I addition sinc th maximu diviso o sixtee bi counte i 65,53 an th inpu cloc woul no b 1.228 MHz th slowes resultin interrupt woul b abou 1 pe second wit n tri contro i tha rang (nex slowes woul b doubl that o 3 interrupts/sec.) Ther need t b bette wa o trimmin th numbe i interrupt pe second i timed-interrupt ar t b use effectively Thi i accomplishe wit U4 an JP-7.

Th output o U4 (CD4024 ar wire t pin 1 an thr o JP-7 Eac o thes pin i successiv divide-by-tw o th previou pin' frequency Th followin pin a JP- hav th accompanyin frequencies an ar normall jumpere t th followin inpu clock o U41:

Pin 1	1.2288 MHz (Baud Rate Generator input)
Pin 3	6144 KHz (Trap timer, INTR timer inputs)
Pin 4	3072 KHz
Pin 5	1536 KHz
Pin 6	768 KHz
Pin 7	384 KHz

Pi 1 o JP- i normall jumpere t th inpu cloc o time i U41 Thi provide a acceptabl cloc frequenc t time 0 whic i use a th bau rat generato fo th packe channel Othe output coul b use i necessary bu th nee fo thi i no anticipated.

Pi 1 o JP- i th inpu cloc t time o U41 Time optionall drive th Tra interrup inpu t th 808 CPU Th tra interrup i non-maskable s ther i n wa o disablin thes interrupt i th hardwar i enabled Usin th secon outpu o U4 usuall give enoug contro o th

resulting interrupt rate.
.pa OPTION SETTINGS (CONTINUED)

Pi 1 o JP- i th inpu cloc t time 2 an i als normall wire t th secon outpu o U40 Time optionall drive th INT interrup inpu t th 808 CPU Th INT pi generate maskabl interrupt whic allow th softwar t selectivel disabl thi interrupt A wit th Tra interrup above th secon outpu o U4 usuall give enoug contro ove the frequency of INTR interrupts.

I an o th timin parameter se b JP- ar t b altered i i recommende tha socke b installe a JP-7 an DI header b use t chang th defaul values Thi i accomplished as follows:

1. Tur th VDS- boar ove an locat jumoe JP- (nex t th U4 socket) Carefull cu th followin traces:

A) Pin 1 to pin 14

B) Pin 2 to pin 13

C) Pin 2 to pin 12

2. Plac 1 pi solder-tai socke a JP-7 an solde i i place.

3. Wire a DIP header as necessary for the alterations requied.

4. Plac th DI heade i th socke a JP-7 an tes ou th changes.

TIMED INTERRUPT ENABLES

Th outpu o th tw timer tha ar capab o generatin interrupt ar normall disable by no installin U4 (74LS00) I time interrupt ar t b used U4 shoul b installed Jumpe JP- i use t selectivel enabl onl on o th othe o th time interrupts a necessary JP- i normall jumpere o fo bot interrupts othe configuration ca b mad b cutting the traces ot the TOP of the board at JP-8 as follows:

1. Cut trace between pins 1 and 4 to disable Trap interrupts.

2. Cut trace between pins 2 and 3 to disable INTR interrupts.

Thes trace wer place o th TO o th VDS- boar t allow easy access to them.

Kee i min tha th timer MUS b properl programme befor time interrupt ar enabled otherwis improe operatio wil result Not tha timer an shoul b programme fo

puls operation rathe tha squar wave sinc th interrupt are level sensitive.

sourc o th reques o th TN boar ar show below.

Interrupt	Memory	Signal	Priority	Interrupt Source
RST 5.5	002CH	High	Low	User Interface
RST 6.5	0034H	High	Middle	U10 (8273) TxINT
RST 7.5	003CH	Pulse	High	U10 (8273) RxINT

     Th highes priorit interrup o th 808 i th Tra
interrup (pi 6) I i non-maskable an generate restar
t memor locatio 0024H I i bot edg an leve sentitive
Th TN boar ha thi pi tie low disablin th Tra
interrupt.

     Th 808 CP als generate som timin signal neede fo
proper computer operation. These include:

IO/M*   Low for memory request, high for input/output
RD*   Low indicated a read function from memory or I/O

WR*   Low indicates a write function to memory or I/O
RESET OUT High indicates the CPU is being reset.

     Ther i als pi calle Ready whic i use t
synchroniz CP operatio wit slowe memory Thi pi i no
used on the original VADCG TNC board.
.pa   THEORY OF OPERATION (CONTINUED)

TNC EPROM MEMORY

     I orde fo th TN boar t functio properly th CP
mus b tol wha t d b program Thi progra i hel i
Erasable-Programmable-Read-Only-Memor (EPROM) Th TN use
fou 270 typ EPRO chips eac o whic hold 102 byte o
program fo tota o 409 byte (4k o progra memory

     Ther i memor decode circui mad u o U (74LS00 an
U (74LS138 tha determine wher i th CP memor th EPRO
(an RAM sinc th sam decode i use fo both i t reside

     Th memor ma fo a unmodifie TN boar is:

          0000H-03FFH   U15 (EPROM 0)
          0400H-07FFH   U16 (EPROM 1)
          0800H-0BFFH   U17 (EPROM 2)
          0C00H-0FFFH   U18 (EPROM 3)
          1000H-13FFH   U19, U20 (RAM 0)
          1400H-17FFH   U21, U22 (RAM 1)
          1800H-1BFFH   U23, U24 (RAM 2)
          1C00H-1FFFH   U25, U26 (RAM 3)
          2000H-FFFFH   Unused, copies of above map

     Th 74LS0 (U7 i use wit th addres decoder 74LS13
(U8) t decod memor read-onl cycle fo th EPROM an memor
read/write cycles for the RAM memory.

     Not tha th EPRO chip ar i th opposit sequenc tha
on woul assume tha i EPRO i th right-most no th
left-mos EPROM Th 270 EPROM requir +5V -5V an +12 t
operate properly.

TNC RAM MEMORY

     Fo th TN t functio properly i additio t EPRO
memor t stor th program ther mus als b som amoun o
temporar memor tha wil b use t stor th dat i need t
process Th TN boar use 211 typ RA chips whic ar 102
b bits Tw o thes chip ar neede t stor complet
bit wort o data Ther i roo fo fou bank o thes chips
fo tota o 409 byte o dat storage Th RA memor share
th sam memor decode circuitr wit th EPROM an i
discussed above.

Sinc th 808 CP use bidirectiona dat bus th IN/OU pin o th 211 chip ar connecte directl t th CP dat bus.

.pa THEORY OF OPERATION (CONTINUED)

TNC INPUT/OUTPUT

I orde fo th TN boar t function i mus ge dat fro th outsid worl t process an the sen th processe dat bac t th outsid worl whe done Thi functio i provide b th inpu an outpu device o th TN board Ther ar tw differen "channels fo dat t transfe betwee th TN an device connecte t it Th firs i th "use interface" an th secon i th lin o packe channel Eac on o thes channel i connecte t th TN CP throug specia ICs whic occup certai por location i th CP por addres space Eac o thes IC i als capabl o generatin interrupt t th CPU when it needs to be serviced.

Th I/ port use ar decode b U9 74LS138 I decode onl I/ por addresses whic ar mappe a follows:

00H-07H	U3	8250 Serial I/O Port (User Interface)
08H-0FH	U2	8255 Parallel I/O Port (User Interface-Optional)
10H-17H	U10	8273 HDLC Protocol Main Ports (Packet Channel)
18H-1FH	U10	8273 HDLC Protocol TX Data Port (Packet Channel)
20H-27H	U10	8273 HDLC Protocol RX Data Port (Packet Channel)
28H-FFH	Unused.	

Th use interface t th VADC TN boar eithe throug seria (RS-23 o curren loop o paralle port Mos o th softwar suppor fo th VADC TN use onl th seria interfac option an the onl a ASCII RS-23 typ o seria interface I woul hav bee nic t hav bee abl t us bot th seria an paralle chip simultaneously bu sinc the shar quit fe o th sam DB-2 connecto pins thi i impractica withou cuttin severa traces an addin anothe connector.

Serial User Interface

Th seria use interfac use a 825 Asynchronou Communication Elemen (ACE) Thi chi ha bot UAR an bau rat generato buil int it I additio t seria dat line i an out i als provide som o th handshakin line typicall foun i a RS-23 interfac (DSR DTR RTS CTS DCD an RI) Th TN boar ha RS-23 drive chip o i t optionall mak thes signal eithe TT o RS-23 voltag levels Sinc th AC chi i complicate device severa I/ port ar assigne t i fo prope programmin an operation

.pa THEORY OF OPERATION (CONTINUED)

These ports are designated as follows:

Port 00   Transmit/Receive Data Buffer Registers.
Port 01   Interrupt Enable Register (Write Only).
Port 02   Interrupt Identification Register (Read Only).
Port 03   Line Control Register (UART Functions).
Port 04   Modem Control Register.
Port 05   Line Status Register (UART Status).
Port 06   Modem Status Register.
Port 07   Baud Rate Divisor Latch Registers.

Parallel User Interface

     Th paralle use interfac use a 825 Programmabl Periphera Interfac (PPI) Thi devic ha 2 line o paralle data eac o whic i programmabl t b eithe input o outputs I addition som o thes line becom handshakin line whe programme properly allowin ful 1 bi paralle Input/Output system with complete strobing and acknowledgements.

     Th 2 line o th 825 ar organize a thre group o line (group A B an C) wit thir grou (C bein furthe divide int tw 4-bi subgroups Th programmin o thi chi i beyon th scop o thi manual howeve th Por ma fo thi device on the TNC is as follows:

Port 08H Port A Data Bus.
Port 09H Port B Data Bus
Port 0AH Port C Data Bus.
Port 0BH PPI Control Port.
Ports 0CH-0FH will be in same as above.

     Sinc virtuall n on i usin th paralle use interface these locations are generally ignored.

Packet Channel Interface

     Th packe channe interfac i handle b a Inte 827 HDL Protoco Controlle chip Th 827 i ver complicate inside i tha i automaticall handle lo o th HDL protoco functions suc a cloc recovery NRZ encoding/decoding zer bi insertion/removal an frame-check-sequenc (CRC generation/checking Sinc th packe channe send HDL frame i synchronou mod (n star o sto bits onc thi chi start sendin fram o data i mus continu unti al th dat o tha fram i sent Ther ca b n startin an stoppin i th middl o sendin frame Thi mean th 827 mus b capabl o gettin th attentio o th TN CP quickl wheneve fram i bein sen o received
.pa   THEORY OF OPERATION (CONTINUED)

     Becaus o this th 827 use th highes interrupt o th TN board Th transmi an receiv dat register als us separat port tha th res o th 8273 Th por ma o th 827 is:

10H 8273 Main Command/Status Register.
11H 8273 Parameter/Result Register.
12H 8273 Reset/Tx Interrupt Result Register.
13H 8273 Rx Interrupt Result Register.
14H-17H Same registers as above.
18H-1FH 8273 Transmit Data Register.
20H-27H 8273 Receive Data Register.

Th 827 doe no hav a interna bau rat generator s a externa divide mus b used U11 CD402 seve stag binar counte i use t divid dow th 2.4576MH cloc t th frequencie necessar fo th 827 t work Th 827 ha digita phase-lock-loo (DPLL tha i use t recove th dat timin o th packe channel Thi DPL need X3 cloc t functio properly Th output o U1 ar sen t switc S2 Onl on o th switche o S shoul b o a an give time Th output o U1 provid fo bau rate fro 38,40 bau t 60 baud.

Th 827 provide mos o th primar signal use i a RS-23 interfac (TXD RXD CTS RTS an DCD) I addition ther ar tw eac use programmabl inpu an outpu pins Th VADC TN feed thes signal t 1 pi DI socke a J4 Th othe hal o J lead t th RS-23 leve converte ICs whic the lead to the packet channel DB-25, J2.

Daughter Board Theory

Th VDS- daughte boar wa designe t replac th memor o th Vancouve TN board I addition i provide softwar contro ove th packe channe bau rate an th optio o tim generate interrupts.

Th VDS- interface t th Vancouve TN throug fou wire-wra socket tha plu int ke socket o th TN board Th firs one i at th CP socket U1 Th 808 CP no plug int th wire-wra socke o th daughte board Usin thi socket severa o th ke signal t an fro th CP ca b easil obtaine.
.pa THEORY OF OPERATION (CONTINUED)

Th nex socke tha plug int th TN i a U18 Thi use t b on o th 270 EPRO sockets Thi socke i use t recove th latche low-orde addres bu fro th latc (U6 o th Vancouve TNC I wa possibl t ad anothe latc o th daughte board bu tha woul hav increase loadin o th dat bu unnecessarily I addition pluggin int U1 provide structura suppor fo th VDS-1 Sinc th socke a U1 i used only as a jumper, there is not an IC that plugs into U18.

Th thir wire-wra socke betwee th tw board i a U9

th I/ por decoder Thi socke i use t ge th additiona por decode outpu fo th 825 time I a U41 U4 use port 28 t 2FH Th I tha wa plugge int U o th TN no plug into the daughter board U9 instead.

Th fourt wire-wra socke i a U11 Thi positio use t hav th CD402 bau rat generato plugge int it Sinc th bau rat i no generate b U41 ther i n I plugge int th U1 socke o th daughte board Not tha al th ol outpu pin o th CD402 ar no shorte together i doesn' matte whic switc a S i closed a lon a a leas on is.

VDS-1 EPROM Memory

Th VDS- boar ha fou socket fo EPRO use Th type o EPROM acceptabl b th VDS- ar 2716 2732 o 2764 Al fou EPROM mus b o th sam type ne EPRO addres decode i use o th daughte boar a U38 Th addres input t U3 com fro jumpe JP-5 JP- i pre-wire fo 273 typ EPRO decoding I EPROM othe tha 2732' ar t b used th trace o th bac o th VDS- mus b cu befor usin JP-5 See the Option Settings section for further details.

Not tha al thre type o EPROM usabl o th VDS- ru o +5 only s th othe tw voltage use b th 270 EPROM ar no neede fo EPRO use Th -5 i n longe neede a all s i ca b eliminated Th +12 i use b th RS-23 interfaces s i i stil needed Anothe advantag o gettin ri o th 2708' i tha th newe type o EPROM ru a higher speed, reducing the potential of timing problems.
.pa THEORY OF OPERATION (CONTINUED)

VDS-1 RAM Circuitry

separat RA memor decode (U39 74LS138 i no use o th VDS-1 Thi allow th RA chi siz t b differen tha th EPROM allowin greate syste flexibility Lik th EPRO decoder th RA decode addres input com fro jumpe (JP-6) Thi jumpe i pre-wire fo 611 typ devices Optionally 626 o 218 typ (8 b 8 device ca b used i JP- i altered Sinc th 218 i psuedo-stati devic (i i reall dynamic bu al suppor circuitr i insid th chip) i need t tel th CP wheneve i i no ready Thi i wh th jumper JP- thr JP-1 ar needed The allo th RA chip t tel th CP whe the ar no read yet an th CP add wai state unti th RA chip ar ready.

VDS-1 Timing Circuitry

On o th problem wit th origina Vancouve TN i tha th use mus chang switche t alte th bau rat o th packe channel I addition th slowes spee th TN boar run withou modificatio i 60 baud Thi i stil to fas

fo H packe operatio a th moment Th VDS- remove thi proble b replacin th CD402 binar counte an S wit programmabl time I (U41 a 8253) Th 825 ha thre separat programmabl timers on o whic i use t creat th cloc fo th 827 Protoco Controller Unfortunately th 825 ca onl handl inpu cloc speed u t MHz Th TN board' cloc i divide b tw b U4 o th daughte boar (th no famou CD4024 whic i the sen t th 825 time cloc input Th outpu o time i the sen t th wire-wra socket at U11, which feeds it to the TNC board.

secon outpu o th CD402 i use t driv th 825 inpu cloc fo timer an 2 Thes timer ar optionall use t driv th tra (non-maskable an INT (maskable interrup input t th 808 CPU Sinc th output o th timer ar activ low the mus b inverte befor sendin the t th CPU Thi inversio i accomplishe b U42 74LS00 Thi I wa lef ove fro th origina Vancouve TN memor decoder I time interrupt ar no bein used the shoul b disable b removing U42.

Jumpe JP- i provide t allo th use t alte th standar inpu cloc rate t th 825 timer I i no anticipate tha thes nee t b changed s JP- i normall not altered.

Not tha i timer o ar use t generat time interrupts the mus b programme fo shor duratio pulse sinc th TRA an INT interrupt ar leve sensitive an wil continue to interrupt as long as the inputs are high.

.pa TROUBLESHOOTING

Sinc th Vancouve TN i complet microcompute system i ca b ver difficul t correc problem tha ma arise I ther i problem us th followin step a guidelin t troubleshoo th TN system I i helpfu t hav anothe TN board available for comparing, and also for chip swapping.

Certai o th followin step ca b ignore i tha par o th boar seem t b functioning If fo example th boar work wit th terminal bu wil no transmi o receiv ove th packe channel th whol TN i no defective bu rathe jus th HDL controlle o it suppor circuitry Th followin step ar mor t hel whe th whol TN seem t b out-to-lunch.

Step 1. Overall Tests

A.Mak sur tha al chip o th TN ar positione properly Th TN boar ha severa chip i differen orientations s i i eas t pu chi i backwards Als mak sur tha non o th pin o th chip i ben unde rathe tha i th socke hole Thi ca b don b lookin carefull dow

th en o eac socket I pi i ben under remov th
chip, bend the pin back, and re-install the chip.

B.I th TN function properl unti i trie t transmit
the eithe send stead tone o continua flag (th
eterna fram syndrome) replac th CD4024 an tr again
Thi chi i EXTREMEL sensitiv t static an i th numbe
one cause of TNC malfunctions that AMRAD has encountered.

C. Chec th powe suppl lines bot wit mete AN scope
Thre termina regulator hav habi o goin int
oscillation, which won't show up on a meter.

D.Chec th TN syste wit monito RO tha i know t
work Sometime EPROM forge bi her o there causin
strange results.

E. Doubl chec th jumper o bot boards I i no
immediatel obviou wha th prope jumpe configuratio o
th Vancouve TN boar should be i al cases.

F.Remov th daughte boar an re-instal th IC remove fro
th TNC Tr bringin u th TN withou th daughte boar
t identif wher th proble is preferabl usin monito
progra i 270 an RA a 1000H-1FFFH I th TN
functions normally, proceed to step 3, VDS-1 Troubleshooting.

.pa   TROUBLESHOOTING (CONTINUED)

Step 2. Vancouver Board Troubleshooting

A. Appl powe t th TN board Usin scope chec pi 3 o
U fo 2.457 MH clock Th actua frequenc i no
importan a thi time a lon a i i nice clea squar
wave I not tr installin coupl 20p capacitor fro
U pin an t ground Sometime th 808 need thes
capacitor t functio properly I tha doesn' correc th
problem replac th 808 (U1) an the th crysta i stil
no clock.

B.Pus th Rese button A lon a th butto i hel down
U pi 3 shoul b low an U pi shoul b high Th
following should also be true as long as reset is held down:

1) Data lines (pins 12-19) should be high.
2) Address lines (pins 21-28) should be 1V. or less.
3) Pins 31, 32, and 35 should be held high.
4) Pins 30, 34, 6, and 10 should be low.
5) Pins 7, 8, and 9 should be low, depending on other chips.

C.Consul you schemati i on o thes pin i no a th
proper level, and look over the TNC board for shorts.

D. Releas th Rese button U pi 3 shoul no g high an pi shoul g low Th followin shoul als b checke (sinc th addres an dat buse ar no buffered thes signal wil no b idealy shape pulses):

1) Data lines should have alternating high-low pulses.
2) Address lines should have alternating ihgh-low pulses.
3) Chec th outpu pin o th addres latc (U6 t mak sure it is latching the low-half address properly.
4) Mak sur th pin 30 31 32 an 3 als hav pulse whe the are supposed to.
5) Typ character o th consol (assumin seria inter face an loo fo U pi (RST5.5 t g hig o eac keystroke.

E.Chec fo active-lo transition o th chi selec pin o a leas th lo EPRO (U1 pi 20) Ther shoul als b intermitten transition o th RA chi selec lines depending on the program being run.

F. I nothin obviou ha be foun a thi point usuall th nex ste i t star swappin chip betwee functiona TN an th defectiv board I al th chip hav bee changed an th boar stil fail t operate i i tim t chec th boar wit mete fo short o ba sockets
.pa   TROUBLESHOOTING (CONTINUED)

Step 3. Daughter Board Troubleshooting

     Not tha al pi number fo EPRO an RA chip mentione belo (excep fo U18 ar assumin 2 pi sockets sinc tha i wha th daughte boar i laye ou for Tak thi int accoun when testing 24 pin devices in the 28 pin sockets.

A. Mos problem associate wit th daughte boar hav t d wit th interconnection betwee i an th TN board Mak sur onc agai tha al socket ar soldere properly an that all the pins line up in the proper holes.

B.Remov U42 i installed Thi wil mak sur n spuriou interrupt ar bein generate b th 825 timers U4 shoul b installe ONL i softwar i include t suppor timed interrupts.

C.Mak sur tha al th jumper o th daughte boar ar correc fo th typ o memor bein used Th VDS- i normall jumpere fo 273 EPROMs an 611 RAMs Se th Options Setting section for more information.

D. Follo throug D i Ste above Perfor th test firs o th 808 itself the o th botto o th TN board' U socke t mak sur al th signal ar makin i throug th jumpers ok.

E.Chec U1 pin t t mak sur al bit o th low-orde address bus are getting from the TNC to the daughter board.

F. Chec th outpu o th addres decoders A minimum U30 pi 2 (EPRO chi select shoul b periodicall pulsin low I addition U3 pi 2 shoul als b pulsin low depending on the software being used.

G. A wit th TN boar itself th easies metho t procee a thi poin i t swa al IC o th daughte boar wit on tha i functiona (i migh b goo t tr th othe daughte boar first) I problem persist carefull g over the daughter board for shorts of bad solder joints.

.pa

SOFTWARE SUPPORT

Ther ar fe modification tha mus b mad t an softwar befor runnin i o Vancouve TN wit th VDS-installed Thes hav t d wit large EPRO space relocate an large RAM softwar contro o th packe channe speed an optionally timed interrupts.

EPROM SUPPORT

Actually n change nee t b mad fo th EPRO spac itself bu th additiona EPRO spac mean tha al RA location equates need to be changed.

RAM SUPPORT

Mos o th program writte fo th Vancouve TN us tw equate fo th RAM on fo th beginnin an th othe en o RA memory Al othe reference t RA memor location ar mad base o thes tw equates Whe usin th VDS-1 al RA start a locatio 8000H Usin fou 611 typ RA chips RA wil en a 9FFFH Thi mean th tw equate ar no a follows:

```
LORAM     EQU  8000H     ; Start of RAM memory
HIRAM     EQU  9FFFH     ; End of RAM memory
```

I addition tw othe equate mus b change i th LIPM.AS fil t mak i wor properly Th orde o thes equates is now reversed, and they MUST be in this sequence:

```
LBALEN    EQU  (HIRAM-LBA)/2  ; LENGTH OF LINE BUFFER AREA
LBAEND    EQU  (LBA+LBALEN)   ; NEXT BYTE AFTER LINE BUFFER
```

TIMER SUPPORT

Sinc th packe channe bau rat i no controlle b software som softwar mus b provide t se th packe speed

I addition th time mus b initialize befor an spee ca
b selected Th mos rudimentar for o cod t d thes
functions at 1200 baud is as follows:

```
     CTR0      EQU  28H  ; COUNTER 0 PORT
     CTR1      EQU  29H  ; COUNTER 1 PORT
     CTR2      EQU  2AH  ; COUNTER 2 PORT
     CTRPRM    EQU  2BH  ; COUNTER PARAMETER PORT

CTRIN:    MVI  A,36H     ; CTR0, SQUARE WAVE, BINARY MODE
          OUT  CTRPRM    ; SEND IT TO THE PARAMETER PORT
          MVI  A,20H     ; LOW HALF DIVIDER FOR 1200 BAUD
          OUT  CTR0      ; SEND LOW HALF TO COUNTER 0
          MVI  A,0       ; HIGH HALF DIVIDER 0
          OUT  CTR0      ; AND SEND IT TO COUNTER 0
```

Th followin i som informatio o programmin th 825
chip I i give i assembl forma t ai i installin i i
software.

```
     CNTR02    EQU  80H  ; SELECT COUNTER 2 FOR PROGRAMMING
     CNTR01    EQU  40H  ; SELECT COUNTER 1 FOR PROGRAMMING
     CNTR00    EQU  00H  ; SELECT COUNTER 0 FOR PROGRAMMING
     RDLDBH    EQU  30H  ; READ/LOAD LOW BYTE FIRST, THEN HIGH
                         ; OF DIVIDER IN COUNTER SPECIFIED
     RDLDHI    EQU  20H  ; READ/LOAD HIGH BYTE ONLY OF DIVIDER
     RDLDLO    EQU  10H  ; READ/LOAD LOW BYTE ONLY OF DIVIDER
     CNTLAT    EQU  00H  ; LATCH THE COUNTER AT PRESENT COUNT
     MODE05    EQU  0AH  ; MODE 5 (HWARE TRIGGERED STROBE)
     MODE04    EQU  08H  ; MODE 4 (SWARE TRIGGERED STROBE)
     MODE03    EQU  06H  ; MODE 3 (SQUARE WAVE GENERATOR)
     MODE02    EQU  04H  ; MODE 2 (PULSE RATE GENERATOR)
     MODE01    EQU  02H  ; MODE 1 (PROGRAMMABLE ONE-SHOT)
     MODE00    EQU  00H  ; MODE 0 (INTERRUPT ON TERMINAL CNT)
     BCDCNT    EQU  01H  ; BCD COUNTER MODE (4 DECADES)
     BINCNT    EQU  00H  ; BINARY MODE (16 BITS).
```

I shoul b note tha eac counte i programme vi th
contro port an tha th actua counte port ar use onl fo
loading or reading the count of the timer.

Consul th Inte 825 dat sheet fo mor informatio o
programming the 8253.

Th nex tabl contain th BINAR divide t loa int th
8253 timer 0 for most common baud rates.

SPEED	Low Half Divider	High Half Divider

```
     !   9600      !         04H       !         00        !
     !   4800      !         08H       !         00        !
     !   2400      !         10H       !         00        !
     !   1200      !         20H       !         00        !
     !    600      !         40H       !         00        !

     !    150      !         00H       !         01H       !
     !     75      !         00H       !         02H       !
     ------------------------------------------------------
```

.PA VDS-1 PARTS LIST

Th followin i lis o part necessar fo th construction of the AMRAD VDS-1 Daughter Board.

QUANTITY	PART NUMBER	DESCRIPTION
1	VDS-1	AMRAD Daughter PC Board.
1	74LS138	1 of 8 Decoder IC
1	8253	Programmable Interval Timer IC
1-4	2716,2732,2764	EPROM Memory IC (depending on size)
1-4	6116,6264,2186	RAM Memory IC (depending on size)
1	40 Pin Wire-Wrap	IC Socket
1	24 Pin Wire-Wrap	IC Socket
1	16 Pin Wire-Wrap	IC Socket
1	14 Pin Wire-Wrap	IC Socket
8	28 Pin Solder-Tail	IC Socket (optionally 4 Solder-Tail an ZI socket fo EPROMs)
1	24 Pin Solder-Tail	IC Socket
2	16 Pin Solder-Tail	IC Socket
2	14 Pin Solder-Tail	IC Socket
3	14 Pin Solder-Tail	IC Socket (Options)
3	14 Pin DIP Headers	(Options)
1	47uF 10V Electrolytic Capacitor	(value not critical)
6	.1uF 50V Disc Capacitor

I am going to modify an old grid-driven power amplifier, which has a
pair of 4-400A's, to a grounded grid input. Has anyone used toroidal
cores such as the Amidon T-200 (commonly used for baluns) for a
filament choke? Most all units I have seen use a ferrite rod for this.
I want this amp to go down to 160 meters.

Many years ago I built an amp using a single 4-400A and used a rod for
the choke. To get enough inductance to be effective on 80 meters,
I had to wind 3 layers of wire on it and the wire had to be at least
no. 10 to keep the voltage drop at a minimum.

My old Hallicrafters "Loudenboomer" amp uses a tap on one winding
of their choke to get a proper impedance match and I hope to do
the same thing to eliminate the need for any input tanks.

Yuki,
Your article on no-code in Japan was very interesting. What are the requirements and privileges of the other three classes?
In Great Britain there are 2 classes of licence, known as class A and class B. Class B only requires a written exam and gives all privileges above 144MHz (and maybe on 70 MHz too, I forget). Class A requires the same written test and also a 12wpm code test (sending as well as receiving), and gives full privileges on all bands.
Can anyone else out there give information on the situation in other countries.

I have seen it suggested that certain tiny insects may "receive" light waves by means of microscopic antennas on their bodies. I'd like to hear more about this.

Canada has three amateur licenses: amateur, advanced amateur and digital.
The amateur exam consists of a multiple choice exam on regulations,
a written theory exam and 10wpm code test.
This gives you access to all bands but only morse code is permitted on HF.
(There are a couple of endorsements you can get on your license but they
aren't important here)
The advanced amateur exam has a multiple choice regulations test (again),
a harder, written theory test and 15wpm morse code test.
This gives you access to all bands and all modes except pulse modulation.
The digital exam consists of the same regulations and written theory as
the advanced amateur exam, but the code test is replaced by a further written
exam on digital techniques.
If you already have the advanced license then you only need to take the written
digital part and this also gives you pulse modulation
on top of everything else.
If you only have the digital license then it gives you all permitted modes
on all bands from 2 meters and up.

I have all three licenses. The digital license seems to focus on
packet radio theory and VHF/UHF propagation and although the math is quite
simple you have to know what you are doing to answer the questions on
packet radio throughput. The digital license certainly was not as popular as
the DOC probably hoped. For what it is worth, my opinion is that
studying for a reasonable technical exam takes as much effort as learning the
code and therefore anyone too lazy to do one is also too lazy to do the other.
I do NOT believe that the digital exam requires a B.Sc. to be able
to pass it ... it is just as technical as the advanced exam but the focus is on
digital techniques instead of analogue.

The DOC has recently issued a notice in Part I of the Canada Gazette
that it intends to change the amateur licensing system. If anyone has details
of what they are up to I'd like to hear from you. My guess is that they will
do away with the digital license and perhaps make our system similar to the
British one with class A and B licenses. They may even change the written exams
to multiple choice.

I am for the morse code requirement. As a child, I watched my mother (K1UZG)
learn the code, and she had no particular problem with it. In fact, once
she got her license, she rarely used voice.

It seems from watching her during her active days, that morse almost entered
her brain through a channel completely unrelated to verbal speech. On many
occasions, she would be cooking supper with three attention hungry children
talking with her simultaneously, while she was carrying on a 60wpm+ QSO with
a friend on 80 meters. In spite of the sensory assault she was under, she
was still able to copy the code.

After I got my license (then WA1JMS), I found that I could communicate with people whose signals weren't far enough above the noise to make a perceptable beat note. I could copy signals that just barely changed the "texture" of the noise, if they were slow enough.

I have found that code is a reliable communications means, working when all else fails. Even the space missions, Mercury at least, had morse as a backup.

Yours, (KA1ZF)

[:::::*::::] "Squad 51..."

flame() {
  I think this `scanner war' is getting a bit out of hand, and you are
  missing Dave's (kk9w@pur-ee) point. The question is *not* is the scanner
  information worthwile, but does it belong in net.ham-radio. I agree
  with Dave that it is not ham related and shouldn't be in this newsgroup.
  If you want to share your valuable frequencies for Northern Outer
  Slavabobia's Doggie Doo Patrol, by all means that information should
  be distributed. However, I think it should have its own net.scanner
  to do so. It is *not* amateur radio (even though many hams have scanners,
  including myself) and does not belong in this newsgroup.}   /* END FLAME */

Now, on to an amateur radio related scanner question. I would like

to know what states have exemptions for amateur radio operators
to carry scanners in their cars and other mobile situations. If you would
mail replies to me I will post the results to the net when I get a
reasonable amount of information. If you have the exact wording of the
law or the state code number, it would be appreciated. For example,
 in Indiana, we are exempt from the prohibition of carring
``portable police radios'' by Indiana Code 35-44-3-12 paragraph 6.

Mark Levine, WA2YBA, raised some interesting points. At this time
I shall not reply to them, but would like to comment on his question:

> I'd really like to know what drives League policy here, as the
> FCC seemed ready to go for this idea [no-code experimenter's
> license] before ARRL started lobbying--does anyone think that
> impression wrong?

At the time of that proposal, I had the opportunity to quietly talk
with the ARRL Director from our Section. His comment was that the
League Headquarters staff and the Directors initially "kept quiet"
as far as recommending "yea" or "nay" to no-code. The purpose was
to see what the response was from the Ham community and in
particular from League members. The response was (according to
him) quite lop-sided against the no-code proposal.

Since the League is really all us dues-paying members (not the
Headquarters Staff as some seem to think), the Directors then
publically came out against no-code, reflecting the views and

opinions of the large majority of the members.

Whether no-code was good or bad isn't what I want to bring out in
this posting. The point to make is: the League membership is what
drives League policy.

Okokokokokok, I'm really terribly sorry that you
don't like the free, scanner-related information we post.

You're SO right!

From now on, I PROMISE to try and keep any information
I have a SECRET, or post it within AT&T newsgroups only!

Please find it within your merciful heart, however,

to forgive me if I slip up now and then, and ACCIDENTLY
share some information with the rest of the world.

And by all means, keep your constructive suggestions coming!

I thank you from the heart of my bottom. :-)

<munchies??>
While we're discussing code requirements and emergency communications, let's
also consider the need for equipment that can operate without 120 (or 230 if
you're in Europe) VAC power. Most 2m hand helds meet this requirement
(especially if you have spare charged battery packs for them) but what about
your low band rig (if you operate on 160 thru 10)?? Field day is a good time
to try emergency power operation and know you're ready if it should happen.
I agree that 2m FM is a viable means of emergency communications IF the repeater
has emergency power.
As for the exam, I'd like to see the technical part of the test reflect modern
amateur practice. The General/Technician and especially the Advanced exams
should have some digital questions on them.
As for tubes in 1984, let's face it - those little glass bottles are more
resistant to electrical abuse (such as EMP among other things) and more cost
effective for use in ham transmitter power stages than are transistors.
If you have a tube rig and you inadvertantly try to run it into a mismatch, you
probably won't damage the rig - on the other hand, a solid state final is likely
to be on its way to the service bench (hopefully on the other side of your shack)
Not that I'm a CW type - I used it when I was a Novice, and I'll use it if its
the only way to get through, but there's plenty of room in ham radio for all of

us. CW is one option of many that hams can use to communicate but it is one that can be quite useful at times

How about 5 wpm to obtain any class license, with the higher classes being obtained through tougher technical and maybe operational examination? That would fulfill the emergency-jury rigged cw station requirement while making it much easier for the technically qualified (badly needed in our hobby) to get into amateur radio.

I would have had a ham license 5 yrs before I finally obtained one if not for cw. I used to have an exclusively homebrew station! GEORGE

qst de k9eui
hr propagation forecast bulletin nr 28 from arrl headquarters
newngton ct july 9, 1984
to all radio amateurs bt

during the past week the solar flux varied between 97 and 104, too small a range to have an observable effect on radio propagation. the earths magnetic field was relatively quiet. the net result was a week of fairly good conditions for mid summer, except for frequent periods of high noise levels from electrical storms.

no large change is expected during the forecast week. the solar flux should rise slightly, peaking around 112. propagation on high latitude circuits will be at its best july 9 through 11. conditions will be more unstable for several days thereafter, through about the 18th.

conditions on 21 and 28 mhz will be near their summer minimum, with activity confined to transequatorial paths and the low latitudes. sporadic e skip will continue on 28 and 50 mhz, but it will be less frequent after the middle of july ar

Subject: Codeless License Summary
Message-ID: <205@mit-athena.ARPA>
Date: Tue, 10-Jul-84 22:16:44 EDT
Article-I.D.: mit-athe.205
Posted: Tue Jul 10 22:16:44 1984
Date-Received: Thu, 12-Jul-84 01:20:28 EDT
Organization: MIT, Project Athena, Cambridge, Ma.
Lines: 70

I would like to summarize the mail sent to me and as follow-ups on the net.

The overall response was pretty evenly divided: 8 for and 7 against a codeless license.

Several people would not stay within the contenxt of a VHF/UHF only license in their comments, but were counted anyway (they were all against).

Following the discussion caused me to notice some things: the Derry, NH 2 m repeater on 6.25/85 is using a voice id where code used to be. On the occasion I served in an emergency with the National Guard up here (ending up as net control for Sector 1B Civil Defense EN as I recall, for about 18 hrs) I used 2 m fm phone exclusively. When my microphone failed, and could only send code, I repaired it--no one out there had a bfo, and I couldn't get my IC230 into the cw portion of the band. FCC is removing two amateur UHF band allocations to other services.

In responses I did not count, becuase they were verbal, I heard a story about ex-WB1CZM, who might read this, as having heard a fellow at a ham fest say, as did many of the con letters: 5 wpm is easy to pick up--anyone can do it in a short while!. He replied "Then it is silly to require it for a license--anyone who needs it will just pick it up!".

Another was from WA2NKL, who told of a club meeting where he asked those assembled: "would everyone opposed to a codeless license for 1 GHz and up please raise one hand." Every hand went up. "Now, would those who have stations operating on 1 GHz and up please raise the other hand?" 1 hand went up.

It seems clear that many of us against the codeless license base our opinions on a fear that we will soon overcrowd the HF bands with lids, and that we will not render a service to the country by failing to know code. The only "good" reasons given were "it is most efficient" and that "when everything else fails, it will still work with two wires." The first is just wrong: QPSK (quadrature phase shift keying), especially with some error correcting code, is more reliable and more efficient--need I add that if we had some no-code but good tech types they'd know that? The second is undeniable if you have the technical competence to build a transmitter; now if you were the one in trouble, would you send SOS, which every child knows, or QRRR and hope a ham heard you?

I know now that the taxpayers get what they want. I also remember that the last I checked there were more CBers than hams. We better keep making rational decisions, not just popular ones. We could otherwise lose more bands to other services.

I was going to try and keep this short. Mind you I do respect the opinions of all concerned. I just think this is worth talking about periodically until all the gut (knee-jerk, I think they call it) reactions are replaced on BOTH sides of this issue by reason. I am sure that I could not get ARRL to recommend a no-code UHF license right now, and I want to see that day. I am sort of bothered that ARRL officers feel they would not be able to be re-elected if they had such a view. At least until I hear some better reasons!

Thanks much to those who answered: WA2IAA (ret.), KD7LZ, ron@brl-tgr, uok!mpackard, sde@mitre-bedford, N2XS, NF4T, W4IZI, W3IKG, Hobbit,

nathanm!hp-pcd, N6JLJ, K3MC, W5USJ, WA7NJK, KN9K, stephenc@tektronix,
KK9W, WA3MEZ, and WA2NKL.

(As soon as I replace my HF exciter, and I get a transmatch, I'll look
for you guys on the air. I have this old Collins 30S1 getting dusty,
and haven't worked cw since leaving Maine. Don't look for me in the
extra class portions until September!)

I've been asked to check around for a program used
to predict propagation, called IONCAP. Does anyone
have a copy or know anything about it?

I believe it comes from the Institute for Telecommunications
Sciences, Boulder, Colorado.

Any info would be very much appreciated. Thanks.

<WA6LBV de WA2YBA>

Either you do not read too well, or you just got justifiably upset.
The whole thrust of the no-code debate is to get people into ham
radio who would develop that portion of the spectrum, at least on
the pro side.

We largely lost it because there are many more people in aerospace
who are willing and able to use the spectrum space than there were hams.
Do you really think that just yelling at FCC or Congress would have
preserved the bands? We have to USE them.

Me, I'm pretty upset, too. Let's not get confused as well.

Except in the special case where local ham groups rebroadcast
space transmissions such as Voyager images (in which case you
can get devices to convert the fast scan ham TV freqs to
normal broadcast VHF/UHF for your TV -- but they still cost lots
more than $14) there aren't any simple ways to receive "space flight"
transmissions. The actual shuttle transmissions are all at
disgustingly high frequencies (e.g. S-band) and are not to
be received with cheap equipment. More and more of these
transmissions are digitized in any case. There is no generalized
"local rebroadcasting" of these images. NASA often uses a
satellite transponder to feed events to the media, but you will
see what they want you to see, not what's coming directly from the
shuttle. Still, it's a lot more than any single media source will
ever show you, and it doesn't have the blabbing commentators. You
need a regular satellite earth station to receive it, and the
feed isn't always there -- only when something significant is

happening. Probably not worth the effort to receive.

That business about generalized local retransmission and $14
converters is bull.

I obtained the Canadian Amateur Operator's Certificate in 1969 - this
licence allows only HF CW and most modes above 6 metres. I have never
bothered to get a higher class licence because in my rather caustic
view, phone is B-O-R-I-N-G.

Why not have licences that do not have CW privileges so you upgrade to CW?

In spite of Wayne Green's wild views about wildly complex equipment saving
us all during a nuclear war...I see only CW being much use when the chips
are down. I can build a CW transmitter or receiver out of just about
anything if I have to. We will all die in the year long winter anyway.

Eliminate the code exam. If a person is interested in morse, he will
learn the code.

  I think this `scanner war' is getting a bit out of hand, and you are
  missing Dave's (kk9w@pur-ee) point. The question is *not* is the scanner
  information worthwile, but does it belong in net.ham-radio. I agree
  with Dave that it is not ham related and shouldn't be in this newsgroup.
  If you want to share your valuable frequencies for Northern Outer
  Slavabobia's Doggie Doo Patrol, by all means that information should
  be distributed. However, I think it should have its own net.scanner
  to do so. It is *not* amateur radio (even though many hams have scanners,
  including myself) and does not belong in this newsgroup.}   /* END FLAME */

Now, on to an amateur radio related scanner question. I would like
to know what states have exemptions for amateur radio operators
to carry scanners in their cars and other mobile situations. If you would
mail replies to me I will post the results to the net when I get a
reasonable amount of information. If you have the exact wording of the
law or the state code number, it would be appreciated. For example,
 in Indiana, we are exempt from the prohibition of carring
``portable police radios'' by Indiana Code 35-44-3-12 paragraph 6.

Now, on to an amateur radio related scanner question. I would like
to know what states have exemptions for amateur radio operators
to carry scanners in their cars and other mobile situations. If you would
mail replies to me I will post the results to the net when I get a
reasonable amount of information. If you have the exact wording of the
law or the state code number, it would be appreciated. For example,
 in Indiana, we are exempt from the prohibition of carring
``portable police radios'' by Indiana Code 35-44-3-12 paragraph 6.

My major reason for upgrading to Extra is to join the Volunteer Examiner
Program. Not only do we have to recruit and train, now we have to test.
It takes three licensed amateurs, at least one of whom is an Extra to
give exams. Exams for Extra Class require all three to be Extra Class
licensees. I am interested in how the VEs will be organized, and whether
ARRL or Wayne Green will be my regional VEC (volunteer examiner co-ordinator).

Any info on the program and how it is going in other areas would be most
appreciated.

I don't know why you guys insist on operating in the 60's.
It's 1984 and any repeater worth the name uses an IC to send
a voice identification. Just because it uses CW doesn't mean
it has to.

I have returned from a trip to visit the Kennedy Space Center. During my
visit I saw several unusual things, one in particular was a tracking antenna.

The reason it caught my eye was that on a plaque in front of the display is an explanation of how it was used at 148MHZ for to collect tracking information. The thing that confuses me is that this display also calls this antenna a UHF antenna. Has the UHF band always been defined as it is today?

I would also be interested in hearing a more detailed explanation of operation. Did these tracking antennas just track the radio emissions from spacecraft? Did these antenna systems operate duplex in two different bands?

The tour guides were unsure of what the correct response might be.

In no particular order:

> "Morse code proficiency and swimming (preferably "drownproofing") should be required for graduation from high school. Make that elementary school!!"

Hear, hear! In fact, let's also have government requirements for carrying an HT wherever we go, mandatory driver's licenses, demonstrable tree-climbing ability, dog ownership, wearing of lifevests at all times, and the indispensible facility of being able to open bottles of Perrier with our teeth. Surely the survival value must be obvious. In fact, if a radio transmitter and a case of Perrier floated along while I was stranded on a small hot desert island, I can tell you without hesitation which skill I would appreciate more.

Or to put it another way: how many readers feel so intellectually incapacitated that they need the government to identify for them, and then require them to learn, life's important survival skills? Raise those hands high....

The point? It's all too simple to fabricate examples of the utility, even the survival value, of CW or any other skill. Apart from their occasional entertainment value, however, such constructions are largely irrelevant to assessments of the value of the no-code license. If a survival skill, whether it's swimming or CW, is of self-evident value to the learners, then they will learn it out of their own rational self-interest. In fact, whether or not they learn it should be taken as a prima facie *definition* of what is in their own self-interest. We all lead complex lives, and no one is better equipped than we are ourselves to make the decision about what is the best investment of our time and energy. [Admittedly a personal belief, but how would you go about generating a rigorous disproof for such a broad claim? :-)]

By the way, has anyone noticed that you really only need to be able to *send* CW -- and only at 2 wpm -- to transmit a distress signal, and yet the FCC only tests for evidence of *receiving* capability? And no one has yet suggested that mastery of CW should be a legal requirement for scanner devotees, airport controllers, taxicab drivers, broadcast listeners, automotive radiotelephone owners, or marine pleasure craft enthusiasts, even though many of them are required to have some sort of FCC-granted license to operate and all are at least as likely to hear our hypothetical distress signals as hams are. Even the local fire department, the police, and the Red Cross, to whom frequencies are allocated and licenses granted and who have an obvious interest in supporting emergency communications, suffer no legal requirement to demonstrate mastery of this mode. Hence it is not our unique position among spectral occupants as emergency communicators that, um, qualifies us for a CW examination requirement; we have no such unique position. ...And I do read QST (and 73, and CQ) nearly cover-to-cover every month, and I just don't see the "ham, lost at sea, finds salvation in rusty CW skills" headlines people keep alluding to. What I DO see is dozens of stories like "John Doe saved the lives of 4 people in a burning car wreck because he had the foresight to carry his 2-meter FM handheld with him and knew the local repeater frequencies." Something is lacking in this mandatory "CW survival skill requirement" line of reasoning. I propose that it is content.

> "Amateur Radio is the only *sucessful* 'self-policed' organization that I know of and the need to learn Morse code does weed out those who are not interested enough to be bothered with 'something they will never use'."
>
> and
>
> > "Now that the argument is over as far as the FCC is concerned for (I am told) at least twelve years, we should all pitch in and try to help and encourage aspiring hams to get past the very minor obstacle that the code represents."
>
> "I've tried. When I show my packet station to any of my friends, they are always impressed by it, and always ask what it takes to get licensed. When I say they have to learn morse code, that is the end of it."

I have had precisely the same experience. I know of a number of people who are interested in packet radio and emergency communications who are actively deterred by the code requirement. In light of this experience, I find the "emergency communications value" argument somewhat ironic. Here is a body of sincere, competent individuals whom I have personally heard say that they would like to get involved in packet radio and emergency communications, but for whom the CW requirement constitutes a sufficient impediment that they probably won't do it. I am personally offended by the frequently-heard smug retort that such individuals "don't measure up" or "didn't really want it". Is this a hobby or a competition? Why should they be expected to demonstrate the same sort of loyalty to apparently arbitrary examination requirements the ham radio service as self-selected old-timers? After all, the ham radio service is working hard to exclude them, and in as pompous and self-serving a fashion as possible. For that matter, the message you are reading at this moment is itself a testimony to the observation that we hams can't even agree among ourselves as to whether the code requirement is a good thing. I suspect that there was more than a little truth in the comment that many rather elitist hams really don't want the ranks to grow. (Crowds the bands, dontchaknow.) I know no better term for this than greed.

So what? If none of those lazy slouches can cut the mustard, what's the cost to ham radio? Potentially immense. A non-ham no-code license is not excluded by the recent FCC no-code response, as I understand their decision. If a separate no-code radio service is established that (unlike CB) does have a theory test as a part of the licensing process, all those competent, sincere, interested potential hams will gravitate towards the service that meets their needs without imposing additional irrelevant (and perhaps capricious) requirements. This will include not only those who would never have become hams because of the CW requirement, but also those who probably could have been coaxed into learning CW well enough to pass the test and then forget it (which is an accurate description of an awful lot of hams I know). Further, these people will not just be bodies to swell the ranks; they'll be the people who are pushing the communications frontiers, the people who have given ham radio its historical and (until recently) deserved reputation as playing a significant role in advancing the state of the communications art. We'll very nearly be losing the wheat and keeping the chaff, if you believe that ham radio exists in part to advance communications. (Everyone on this net better realize by now that ham radio is about a decade BEHIND the state of the art in "advanced" techniques such as packet. After all, how do you think this message reached your mailbox? We're still playing catch-up at the moment.) Somehow there must be some larger and more meaningful set of goals for ham radio than merely "keeping the CBers out"; what's the

I must say that I've been impressed with the quality of
the code/no-code discussion, although it's probably time
to put the subject to bed. Having contributed my own
(anti-code) two cents worth, I received an excellent reply
by mail and have learned a lot from the discussion here.

I'm a non-ham who has entertained a longtime dream to join
the fraternity. Realistically, I know that code is no
obstacle. The bigger obstacle is the time and expense of
setting up a station. And it's damn hard to home-brew
equipment approaching the quality of modern commercially-
available stuff.

But I never did get an answer to my one question... Are they
still asking about triodes on the tests?

This past weekend I was in Auburn, CA and the Lake Tahoe area for the Western States 100 Mile Endurance Run. This is generally acknowledged as the TOUGHEST physical endurance contest in the world, leaving the Ironman, Tour de France, Swim around Manhattan, etc. in the dust (or waves). The race is 100 miles in the Sierra Nevada's in 24 hours, with an altitude gain of 17,000 feet and a loss of 22,000. The temperature ranges from below freezing to 100+ degrees.

I was 'crew' for a runner and of course, took along my handheld. Sure enough there was a net on 2 meters covering the race, dispensing and collecting all sorts of useful information. At one aid station a ham had a speaker rigged up to his mobile and had a real crowd listening to runner position information.

In terms of EMERGENCY SIMULATIONS, running races are excellent. We had 350 + 'victims' here, with all sorts of medical problems. The logistics problems range from getting food and water to some extremely remote locations to supplying medical aid for: heat stroke, hypothermia, hypoglycemia, and all sorts of foot and leg problems to getting clothing. The analogy to a disaster simulation is quite apt. This was a remote and rural locale, but the large marathons in major cities would represent an urban emergency.

So next time you hear of a 10 K or Marathon or Triathlon in your city, why not offer to do race day communications on a local repeater (or emergency one if you have it)? Try to get involved with the logistics as well as keeping track of the leaders and laggers. Be sure to have lots of 'listen only' stations around the race to relay BY WORD OF MOUTH to the crowd near them the progress of the race. This one-on-one interaction with an amateur radio operator generates all sorts of good PR, and increases the respect and visibility of your club.

The story I heard was an airplane pilot who used morse on his Push to
talk switch because the audio was out in his radio. I'll admit that all
I use CW for is decoding identifiers on repeaters and navigation transmitters
but I'd feel better if the people who I'm sharing the airwaves with also know
it.

I'm in the process of getting (re)started in radio controlled airplanes.
I'm looking for an explanation of what to watch out for in the way of
frequency interference. I know it is quite possible for someone to be
flying on freq. A, and have someone else on freq. B shoot him down. What
I'd like to know is what causes this (in layman's terms) and which frequencies
have such conflicts. Also, how are the problems compounded when more than
two radios are involved? I have seen problems at our field where three
different frequencies are being used, in which one person is getting lots
of glitches. If only two of the planes are flying, everything is fine.

The radio I have on order is on one of the new channels specifically for
flying. The channel number is 54. (Sorry, don't know exact freq.) Anything
I should know about this specific frequency?

Any help in this area is greatly appreciated.

<gulp,gulp>
I agree, Operation ID is a great idea. Often you can borrow an engraver to mark a permanent ID on your valuables from your local police department. Whatever you do, DONT use your Social Security Number as the ID, it can't be traced, since the law prohibits the Social Security Administration from releasing SSN's to the police.
A driver's license number is one option, but since some of us don't (or can't) drive, there are several other options.
1) If you are a ham, use your ham call - an option I use myself, since the call can easily be looked up in the Radio Amateur Callbook or traced through the FCC.
2) Unfortunately, the serial numbers on much electronic gear is not permanently marked on it (I've noticed this with much stereo equipment). Engrave the serial number on the chassis of the equipment. Then record the serial numbers and give the police a copy of the list if the things are ripped off.
One advantage of this approach is that it does not destroy the resale value of the equipment. In fact it can be a selling feature ---
Case history:
A friend of mine bought some stereo gear from me (a receiver and a pair of speakers) a while ago. Like all my stereo equipment, the serial numbers were quite permanently and prominently engraved on the items. Unfortunately, he was ripped off and the thieves took his brand new tape deck and turntable. However, they left the receiver and speakers after seeing the ID eq engraved on them. Operation ID works - It can keep your stuff from being taken and can help you get it back if it is swiped.

Okay -- I am strongly anti-code (as in code-for-the-sake-of-code), but as someone pointed out, *I* may be the only one receiving a signal so I have a responibility to have at least a minimal skill in code. 5 wpm has been generally agreed upon as a acceptable speed, so I can live with that as a requirement for a license.

BUT -- IT WILL COST!

(1): 5 wpm on *all* classes. This worship of code-for-the-sake-of-code is *extremely* repugnant to a lot of us you need to keep your upper bands. My personal interests are on *development*, not the actual communication. Perhaps in a few years I my tastes will change to where I enjoy rag-chewing on CW, but the emergency communication argument for CW is the only one I (and a lot of others) will accept.

(2): You want technical competence required -- demand it. For a general class license, all new *and* renewed licensees must build, from components, one major subsystem of a radio. Included must be design notes, assembly records (photographs of partially assembled board and licensee), and testing results. Furthermore, each licensee must undergo verbal examination by the volunteer examineers. And I mean questions like: if your FM transmitter (if that is what they built) changes the modulation level by the amount dm, how does this affect the n-th sideband ? (by J' sub(n) (m) * dm). How is total bandwidth affected? (Dependent upon the location of the zeroes of the Bessel functions) While a person could still learn this by reading a book (sin that that is!), the fact it is a verbal exam will ensure that the licensee *must* have an adequate technical expertise.

For the advanced licenses -- you guessed it -- design and build a complete transceiver. This radio must include *both* digital and voice capacities. Furthermore, this radio must be operated under the control of both the operator (via the front panel) and a computer (via keyboard entries). Because of the scale of this project, individual modules can be purchased pre-assembled (e.g., power supplies, low-level computer i/o, various filters), but a significant amount of assembly must be done solely by the licensee.

(3): Serious discussion is started about removing archaic requirements for a license. Included in that is a no-code/digital-only/high frequency license. Everyone keeps saying "not for another 12 years", well to me that is "in only 12 years." And you better believe that if I suffer through the higher code speeds (for the advanced license -> the technical aspects I want to free from archaic demands) that I will be a vocal member concerning such policy. It will be far better to approach the FCC in 1995 united with a new license requirement than divided and sharply quarreling.

A comment I frequently see, "If you don't have to overcome obstacles, it wasn't as satisfying when you succeed" overlooks one important fact: THEY MUST BE NATURAL OBSTACLES! I have been working (on and off) for 2 1/2 years to get in shape to jog over 12 miles along pristine Florida

coast. That is a very large natural obstacle, as I will be forced to jog in either soft, loose sand or in the breaking surf (or both). And after all this time, I am still doing well to travel 4 miles in a jog. After I run it, yes, I will be extremely happy. But if someone came to me and said "Miss June says she wants to see you *now*, follow this path" and it is a torturous path which takes a considerable amount of effort to complete, and when I finish I find out that a different path (which the original person knew) was far shorter and more direct, then when I next see the person who sent me on the long path he had best run for his life. I'm not lazy, but I feel *I* am the best judge of how my time is best spent, and overcoming artifical obstacles is just above transporting the Atlantic Ocean into the Pacific via a teaspoon in priority.

Someone on the net wondered if 148 MHz was UHF. Well, it's not.

I don't know if I have this all correct but the general spectrum is as follows:

kHz	"Band"
.3 to 3 kHz	ELF
3 to 30 kHz	VLF
30 to 300 kHz	LF
300 to 3000 kHz	MF
3 to 30 MHz	HF

```
     30  to   300 MHz   VHF
     300 to  3000 MHz   UHF
        3   to    30 gHz    SHF
     30  to   300 gHz   EHF
```

I don't remember where it goes from there.

I like to see the "scanner" and other frequency lists. I would not
object to a net.swl group either. If that is not practical for some
reason, then it best belongs here, I think.

By the way, last nite I heard a station on 179 kHz. It was WGU20
and they gave the time every 10 seconds..

I have heard this station in years past. I think they are in New Jersey
and it is run by NOAA. Anyone got any info on it???????

(They were 10 over S-9 on my R-1000 with a 25 foot vertical and a tuner
but I could not find them on my early 70's vintage Zenith Transoceanic).

WGU20 is a US Government station operated on 179.0 KHz by the Federal
Emergency Management Agency (FEMA). WGU20 is authorized to run 50,000
watts using emissions of type 0.60F1, 6A3, and 6A9.

The station location is listed as Edgewood Arsenal, Maryland.

<munch, munch>
As I once told a friend of mine who is considering getting his Novice ticket...

"Ham Radio isn't one hobby, it is many". To many people, hams are people who work DX and rag chew on the HF bands, but as we know there's more to hamming than that. There is CW operation (either informal rag chews or formal traffic operation - actually most traffic nets prefer CW, due to the natural ambiguities of copying phone - letters sounding alike, etc,) and there are those who make CW proficiency a goal to be achieved (the League runs high speed (at least to 60 wpm) tests on W1AW several times a year - check QST for details).
Of course if you're not into CW or phone, there's always slow scan TV, amateur TV (on the 432 MHz band), moonbounce, ASCII operation, etc.
Some people concentrate on contests, some on traffic, while others just like to ragchew, and I think there's room on the ham bands for all of us. However, we must not lose sight of why the FCC has granted us all this spectrum:

1) Hams have been pioneers in the use of radio, developing useful new communications techniques (who found that the shortwave bands were useful for DX and that moonbounce was feasible?)
2) Hams are a national resource of people trained in communication techniques that can be used in an emergency.

Given those two things, I'd like to see the exams encourage a wide range of technical skills, but would also like to see the code requirement kept, since one never knows when you or the country may need it.
As for mpackards comment that CW is less useful on VHF due to its limited range, I respectfully disagree. There are several long distance means of 2m propagation like aurora that really can't be used with anything BUT CW due to the wavering Doppler shifts of the aurora. Also, if I have to operate 2m simplex in an emergency where most of the repeaters are knocked off the air with a 1 watt hand-held with a "rubber duck", I need all the help I can get to get through, and I'm going to use CW.

[] <--Eat Me

I've been working on radars since 1972 and currently am a crewmember
on the E3 AWACS and during all that time I've never broke or failed
to operate the equipment within specs because I didn't know morse code.
I believe what the hams want is competent operators and technicians.
They don't want some puke splattering or intentionally jamming his
fellow amatuers. They want a pure spectrum where everyone can talk
or key a conversation. I think the code has a perfect place in HF but
is only a nuiscence in the bands after 10 meters. In Oklahoma all the
popular repeaters use voice ID. I first got interested in amatuer
radio in high school and this guy told me that I couldn't use it unless
I learned code. So we listened to HF and some of us eventially got
profficient but 95% of the group went on to metal shop and said screw
this! In USAF tech schools these guys are refered to as ditty boppers
and most of them can't even tie thier shoes yet. I agree morse is
easy to learn, so then why require it as then you'll get a bunch of
people who got their liscenses the easy way!

Sorry, but voice id's are obnoxious. If they are loud enough to be legal
they will obliterate the traffic on the repeater. The reason for CW besides
being easy to build and easy to set remotely, is that most people, who are
uninterested in the ID, can mentally tune it out.

I've heard that the Canadians have a no-code packet license and
have had very few applicants. Something was posted to the net
recently about the Japanese no-code license and I heard a few
verbal comments that it had a very negative impact over there.

These are things that I've heard, but does anyone have any facts
on the 2 situations ? I'd be interested in hearing them.

  I vaguely remember reading somewhere (QST?) about problems with
Toyota ignition systems in cars equipped with 2 meter radios. I am
considering buying a Toyota and would GREATLY appreciate any info
such as:

      1) A source for the original article

      2) Your experiences with 2 meters (or any other band) in
         your Toyota

Thanks in advance!

Your comments on NO CODE are good and the guys that say "I did it so should you" are appropriately cited. I like CODE and as many others have testified, in an emergency (by the way this is what Amateur Radio is about except for those hobbiest only guys) CW is the answer . A basic question on the FCC test asks what HAM radio is to be used for. The answer is to further develope technical skills in communications and for "PUBLIC SERVICE".

All in all I believe that CODE is quite important "NOT" to "KEEP OUT the CB'ers" but to insure the necessary skills to perform the REAL Amateur Radio Tradition to serve the public.

NO the HAM RADIO has not lost it's thunder!!!!! We are very much in the news on sattelite communinications, over seas message delivery(by the way I have had to resort to CODE to get important messages through that other methods failed), disater communications, PACKET RADIO, SPREAD SPECTRUM, etc,etc,etc.

The bottom line is , HAM radio is a hobby SECOND and a service first. To do that and do it well we must know the basic modes of opereation to get the job done. By the way I have taught several quote "CBers" and they are all first class operaters as HAMS.

Into the fray ....

I can't quite see the argument that Morse code is too much work to
learn. I got my Novice license when I was 22, and thought it was a
heck of a lot easier than taking the test that I took 2 years earlier
to get my 2nd Class Radio-telephone license.
Besides, the 2nd class doesn't require any code. It was just the volume
of information that needed to be learned to pass the written test
that made it difficult.

I think it is just that old human problem of doing what you really want
to do and griping about the rest. If a person REALLY wants to do
something they will re-arrange schedules, make the effort, and do
whatever else is necessary to get it done. I don't think that
Morse code is so difficult that anyone can't learn. To get the
5 WPM all you have to do is memorize the characters. I bet you have
to learn 26 new tasks when you buy a new IBM PC. In this case you
have to memorize 26 new characters. (I suppose for the flamers I
should add that you have to learn 10 numbers and a few punctuation
marks.)

Anyway, I feel better now.

> 1) If you are a ham, use your ham call - an option I use myself, since the
> call can easily be looked up in the Radio Amateur Callbook or traced through
> the FCC.

This is fine, except that most of us won't recognize it as a ham call.

> 2) Unfortunately, the serial numbers on much electronic gear is not permanently
> marked on it (I've noticed this with much stereo equipment).

This is fairly stupid. (although maybe it helps them sell more units as replacements :-))

Putting the serial mumber on it permanently sounds like the best idea.
Especially if you might sell it in the future.

The National Crime Information Computer (or something similar) is a nation wide network tying all law inforcement agencies together. The standard approach for identifying an individual is by either their social security number or their name and date of birth. If you have ever legally driven a car or earned money in the US, you are in there along with your address, description and any crime, misdeminor or parking ticket. The base key for the data base is your social security number (which is why they tell you to put your social security number on property for protection, if recovered by the police anywhere in the US, you will get notified).

qst de k9eui
hr bulletin nr 54 from arrl headquarters newington ct
july 12 1984 to all radio amateurs bt

fcc today acted on four items of interest to amateurs,

1. the commission adopted rules to permit the recoupment of expenses by volunteer examiners, ves, and volunteer exam coordinators , vecs. the rules provide for considerable flexibility on the part of ves and vecs and do not require that either party be necessarily reimbursed. vecs will be permitted to make estimates of anticipated expenses to establish a fee structure. if actual expenses are less for the year, the vec will be allowed to simply reduce fees accordingly in the following year.

2. acting on a number of petitions for reconsideration of its volunteer examination rules, the commission adopted a number of minor changes. the most significant of these is that vecs will be permitted to design their own exams in accordance with a commission supplied formula. the revised rules envision, two years in the future, permitting ves themselves to design exams.

3. fcc adopted a notice of proposed rulemaking, nprm, in which it is proposed that non-government hf broadcasters licensed by the fcc in itu region 3, for example guam, be permitted for the first time to use 7100 to 7300 khz.

4. fcc adopted another nprm that proposes to revise part 73 of its rules to eliminate the existing requirement that broadcast stations obtain prior fcc permission before rebroadcasting amateur radio transmissions. at the same time, fcc proposes to clarify its amateur radio rules to make it clear that amayeur radio stations may not, even in an emergency situation, be used to supply communications on behalf of the media.

the full texts of these actions are expected to be released within 10 days. both nprms will allow 60 days from the date of their publication for comments. prospective commenters should refrain from filing comments until they have seen the full text. ar

qst de k9eui
hr propagation forecast bulletin nr 33 from arrl headquarters
newington ct august 13, 1984
to all radio amateurs bt

the solar flux reached a peak of 93 on august 10 and then turned downward, to 86 on the 12th. it is expected to continue downward for several days. as in recent weeks, variations in the flux level are not expected to be a major propagation factor. we have had some good days already in august, and a seasonal pickup has been observable on 21 and 28 mhz.

fluctuations in the earths magnetic field will influence propagation to a greater extent. magnetic k and a indices were rising at bulletin time, with high latitude circuits suffering accordingly. generally low signal levels will prevail early in the forecast week, but propagation will improve after august 15. fair to good signal levels and reduced fading will be observed most of the time august 16 through 24, but more trouble is likely august 28 through 31. no large changes in the solar flux are expected until early september.

american sunspot numbers for august 2 through 8 were between 10 and 26 with a mean of 20.0 ar

hr arrl bulletin nr 63 from arrl headquarters
newington ct august 6, 1984
to all radio amateurs bt

the fcc has received two petitions for rulemaking requesting that the 220 mhz band be shared with land mobile radio services. remember, these are petitions for rulemaking and not fcc notices of proposed rulemaking. see qst march 1982, page 66, for comment proceedures.

rm 4829, filed by the land mobile communications council, lmcc, principally seeks frequencies in the 800 mhz band, but says that portions of the 220 to 225 mhz band could also be used for land mobile radio services.

rm 4831, filed by a manufacturer of amplitude compandored sideband equipment, sideband technology, inc., asks the commission for 216 to 225 mhz for narrow band ascb channels for private and government land mobile systems.

comment deadlines for both petitions are august 29, with reply comments due on or before september 13. ar

Jim Boddie (KC2VQ) raised the question about Owen Garriott
operating in space without an Extra-Class license. I thought I

might see someone else respond, but nothing so far. So here is the quote from the "W5YI REPORT", July 15, 1983:

> Astronaut Dr. Owen Garriott, W5LFL, scheduled later this uear aboard the NASA "Spacelab 1" on the Space Suttle Columbia wrote the FCC on June 1, and 13. He explained the operation in technical detail and requested waivers of certain provisions of the Amateur-Satellite Service Rules to permit him to operate a ham radio station aboard Space Transport System flight 9.
>
> Garriott sought the approval on the basis that it "will advance the long tradition of achievement in the Amateur Radio Service." STS-9 is scheduled to take place between September 30 and October 8, 1983. Dr. Garriott is a licensed Advancded Class amateur radio operator and will be the first ham to operate from space.
>
> .
> .
> .
>
> In favorably ruling on the Garriott request, the FCC's Jim McKinney (Chief of the Private Radio Bureau) said that waivers were "in keeping with our statutory mandate to provide experimental uses of radio frequencies, and to encourage the larger and more effective use of radio in the public interest." The Temporary Waiver Order was signed by McKinney on June 27 and specifically acknowledged the pioneering nature of Dr. Garriott's venture.

Hope this clears thinks up.

Forwarded with edits from triton1!condor (Rick Kawala; I forget his callsign)

Right now, there are two acts pending before Congress that would protect the rights of people to use satellite dishes to receive whatever they can. Call your Senator and urge her to support S.2437. Call your Representative and urge him to support H.R.5176. It's quite easy; all you do is call them (get the number from the Federal Information Center in your town) and say "I want to voice my support for bill number ...". They'll take your name and say thank you very much.

If you think that's bullshit, remember this. There is a lot of neat stuff up there. And it's getting very cheap; $4K buys you a really good earth station, and $2K can buy you a relatively poor one. These prices are somewhat retail, and do not include installation. If you hunt and can do some work yourself, [or ask Lauren --gnu] I'll bet you could do it even cheaper. And if you don't call, they're gonna eventually have it set up so that you have to get permission to receive FM in your car. These things just sort of creep up on you; it never happens at once, but instead it happens thing by thing. Eighty years ago, it was quite OK to walk around with a loaded gun. That's gone today. Do something about it now.

Enjoy, Rick [& John, KB6DQC]

I'm not sure I saw the original note that prompted Joe's response, but I do have some observations on what he said.

Saying (in effect) that automatic digital communications is just

a mechanized form of CW is like saying jet airplanes just do the same thing that people do with their feet. Even though the basic job may be the same, the speed, reliability and cost of the job makes all the difference.

Even if the differences between two systems are quantitative instead of qualitative doesn't mean that a newer, faster way of doing something can't make major changes in our lives and allow us to do completely new things that were previously impossible.

Phil Karn, KA9Q

GATEWAY: The ARRL Packet-Radio Newsletter
Issue 1
Electronic

WELCOME

Welcome to Gateway, the ARRL packet-radio newsletter. Some of you reading this are deeply involved in amateur packet radio, some of you are just getting started on this exciting new mode, and some of you aren't quite sure what "packet radio" is. We hope that Gateway will have something to offer each of you.

WHAT IS A "GATEWAY?"

A gateway is a station that links two communications networks. In amateur packet radio, gateway stations are being used communicate between VHF and HF networks, and between VHF networks and satellite channels. Eventually, users of local VHF networks will use gateways to connect to an international packet-

radio network. We have called this newsletter Gateway because we hope that it will, like a gateway station, facilitate communications between amateurs interested in packet radio.

Gateway will not be a technical newsletter; there are already several fine packet-radio newsletters covering technical issues. This will be a "news" newsletter. At ARRL Headquarters we have many sources of news not all of which are available to each of you. This newsletter will bring together notes from these sources. Overseas and domestic packet-radio club newsletters, the FCC, the IARU, on-line conferences and on-the-air bulletin boards will contribute. You may see items that you've seen elsewhere, but you should also see things that are new and interesting.

Some of you are receiving this packet-radio newsletter and have never even considered what packet radio can do for you, or what fun you could have on packet. We hope to provide you with an overview of the state of amateur packet radio, explaining what is being done and what can be done on this new mode.

It seems as though every packet-radio club is undertaking some project that will advance amateur packet radio. To make these projects fruitful, we must make the most of the limited resources available to amateurs. By telling a large audience about various packet-radio development efforts, Gateway should help organizers direct their efforts, and help volunteers find the groups that need them.

Perhaps when there is a worldwide amateur packet-radio network there will be no need for packet-radio newsletters. Until then, we hope that Gateway informs and interests you.

PACKET METEOR SCATTER

Last weekend's Persieds meteor shower provided a good opportunity to experiment with packet-radio meteor-scatter operation. Rich Zwirko, K1HTV, set forth some experimental guidelines, and stations throughout the U.S. attempted MS QSOs.

On August 1, well before the peak of the Persieds, W0RPK, the station of the Central Iowa Technical Society, held schedules with Bob Carpenter, W3OTC, in Maryland. The skeds were on 6 meters. Bob received about 2% of the packets sent from Iowa. Four nights later, again on 6 meters, W3OTC and W0RPK had what is believed to be the first amateur packet-radio meteor-scatter QSO.

As the Persieds approached, stations tried their luck on the 2-meter band. Stations in the East included K1HTV; Vern Riportella, WA2LQQ; Tom Clark, W3IWI; Hank Oredson, W0RLI; and Mark Wilson, AA2Z. In the West were Ralph Wallio, W0RPK; Bob McCaffrey, K0CY; Ron Dunbar, W0PN; Mike McQuiston, WA0WYW; Bob Schiers, N0AN; and Terry Van Benschoten, W0VB. Several of these stations copied beacons and connect requests via MS. On the morning of August 12, during the peak of the shower, W0RPK and K1HTV completed the first packet MS QSO on 2 meters. Congratulations are in order for all stations involved in these tests, and I hope that I haven't left anyone out.

These tests were performed at 1200 bauds, using AFSK FM. While it was necessary to use this mode in order to include as many stations as possible in the experiments, a performance sacrifice was made. We should organize further tests at higher transmission rates with more efficient modulation techniques.

ARRL APPOINTED IARU PACKET CENTER

The ARRL has been appointed IARU packet radio "information clearing house." The following is exerpted from the minutes of the IARU meeting in late July: "ARRL is nominated as the international clearing house of information relating to packet radio on behalf of the IARU, with a view to encouraging common standards and regulations."

This points the way toward international understanding and acceptance of packet radio standards generated in the United States and Canada. Several European amateurs have hesitated to get involved in packet radio because they were not sure which standards would "catch on." The appointment should help to alleviate this confusion abroad as to what is really happening in North American packet radio.

PACKET RADIO ON NETWORK TV

On July 16 at 0745 PDT, a packet from N6ECT was heard throughout the nation on the CBS Morning News show. Curtis Spangler, N6ECT, was being interviewed by CBS for a piece on the Haight/Ashbury and the film crew focused on his CRT. As luck would have it, Curtis was transmitting packets through the KA6M

digipeater. The audio from one of the packets came through loud and clear, and the frame was heard in all 50 states and throughout half the world! Via KA6M.

220 MHz and PACKET RADIO

The 220-MHz band is crucial to packet radio for a couple of reasons. Because it is the lowest frequency band on which we can exceed 19,600 bauds, it is going to be used for the initial high-speed intercity linking. It is not being used for any satellite uplinks or downlinks, and so it is essential for full-duplex teleport stations. With these considerations in mind, we note the following:

The Tri-State Amateur Repeater Council has coordinated a 100-kHz channel from 220.5 MHz to 220.6 MHz for wideband digital communications. This council coordinates VHF frequencies in northern New Jersey, southwestern New York (including Long Island) and Connecticut. This paves the way for EASTNET linking to begin as soon as hardware and software are ready.

On the negative side are two petitions for rule making which threaten the 220-MHz amateur band. The first is RM-4829 from the Land Mobile Communications Council. This petition calls for the FCC "to explore the potential use of vacant spectrum in the UHF TV bands, spectrum allocated for Fedral Government use, or assignments from the band 220-225 MHz to satisfy the requirements of land mobile users." This may sound worse than it is, since the petition goes on to say "Because of the limited number of channels that the 220-225 MHz band will provide, however, it is not anticipated that this spectrum can meet the immediate requirements of land mobile licensees."

Another petition (RM 4831), from a manufacturer of amplitude compandored sideband equipment, explicitly requests reallocation of the band 216-225 MHz. This petition poses a serious threat to the 220-MHz amateur band.

Packet radio needs the 220-MHz band. Be sure to read these petitions and send your comments to the FCC. The comment procedure was outlined in QST, March, 1982. The comment deadline for these two petitions is August 29, 1984.

WHAT'S BREWING AT TAPR?

This piece came from Harold Price's answer to the question "Is TAPR up to something?" Harold is part of the TAPR software design team, and he made these comments while he was "Member of the Month" on Compuserve's HAMNET.

"The following views are mine alone, and do not necessarily refect those of TAPR, AMSAT, VITA, LAPG the staff, management, or janitorial departments.

"The TAPR folks are indeed up to something. We have the TAPR Pascal code running happily under a simulated environment again. The software, with only one change, runs under TURBO Pascal on the Pronto-16. This will vastly speed up development, which has slowed down as of late.

"The plan is to come up with version 4.0 of the TAPR TNC software which will allow testing of both datagram and virtual connection protocols. I think the level two wars are over. With 1300 TNCs in the field from 6 "manufactuers" all running the same level two, anyone proposing a switch now is just rocking the boat. The few proposals I've seen for different level twos offer no concrete advantages over what we've got now anyway. Besides, level two is boring (now that we have one that works). The real fun is level three.

"For the newcomer, level two refers to a point to point protocol, linking one TNC to another with no TNCs in the middle. There is currently a necessary kludge in AX.25 called digipeating which is a very demented level three feature. Digipeating allows two TNCs to be connected using a third as a relay. Without this simple addition to AX.25, packet may not have taken off as it did, since digipeating allows many more users to reach each other. If you haven't got a wide-coverage duplex repeater (or even if you have), digipeating is your best bet for now.

"Anyway, level two is point to point, with level two+ in current style, multihop dumb repeating. The + in level two will die a happy death when we get level three up and running. Level three links two end points thru multiple intermediate TNCs. The linking is done in an intelligent manner. ACKing is node to node rather than end to end. In level two digipeating, each intermediate point simply regenerates the packet. It does not

ACK it. The final end point ACKs it, and the ACK is blindly repeated back to the starting point. If any repeat of the packet, or the ACK, is stepped on or dropped, the packet must start over from the beginning.

"In level three, an ACK can occur at each step of the way. Thus, a packet may only have to be re-sent between relay points five and six, rather than starting again at point one. So why don't we get on with it, you might ask?

"There are many problems involved in design and implementation of a level three network -- flow control, network blocking, routing, on and on. What is TAPR doing?

1) A node in a level three network will want to be connected to more than one other node. We will allow the TAPR TNC to maintain multiple level two connects. This has several implications. First, you can carry on two or more concurrent conversations. Not so good for rag chewing maybe, but great for emergency communications. Imagine a TNC in the local disaster center. Currently you can carry on a conversation with only one other TNC, with limited possibility of a priority break-in from another TNC. With all outlying TNCs connected to the central node at the same time you get closer to what you want, high reliability connections with each of the field guys at the same time.

"Next, and even better, you can automatically route one connection stream to another. Maybe an example is called for. The syntax below is probably not what we'll end up with, but the idea is:

```
 MYCALL NK6K
 [1] CONNECT WB6YMH
     [1] CONNECTED TO WB6YMH
 [2] CONNECT WA6JPR
     [2] CONNECTED TO WA6JPR
 ROUTE [1] TO [2]
```

"Your TNC is now a network node. Anything that comes in from stream [1] gets ACKed at level two. The data from the packet gets routed to stream [2] where it gets sent out and saved until an ACK comes in on stream [2]. The reverse is also true, incoming from [2] goes to [1].

"Now, wouldn't it be great if you could cause the other guys board to make a connection? If I could tell WA6JPR to make a level two connection to WB5EKU? Then what we have is the level three function, endpoints linked thru multiple intermediate points. A lot of things are missing, but this simple mechanism allows testing of level three concepts without a lot of hassle on the users part. We will also design an interface (based on asyncronous LABP) between the TNC and its attached computer to allow the computer full control over the link process. This permits the use of the TAPR TNC as a level two black box, with level three functions done in your host.

"Do I expect everyone to run verson 4? Well, why not? Version 3.1 can still be used point to point, and thru 4.0 gateways get full access to network. But just as everyone having the capability of being a digipeater added to the swift growth of packet, so will the ability of each TNC to be a level three node.

"But I ramble. Not only does a network node need to support multiple level two connections, it might also need to support connections on multiple RF channels. Let's assume a 1200-baud link on 2 meters and a 2400-baud link on 220, feeding a 9600 baud link on 440. The hardware arm of TAPR is designing a fancy multiport hardware controller. Several designs have been proposed, including a motherboard with slots for plugging in a number of channel-controller cards. Each channel-controller card is a mini TNC, handling all channel-access and level two functions. The mother board passes data between channels and handles level three and higher functions.

"We don't expect everyone to have one of these TNC-LINKs (say "tink link"). But they will make great mountain-top controllers, especially when used with the PACSAT 9600 whiz-bang modem, which has been described elsewhere.

"How long do I see TAPR building kits? There are two answers: "As long as there is a demand" or "Until we can't stand the sight of them anymore." I haven't been pressed into the chain gang of kit packaging, but isn't much fun, especially when serial number 1000 has long since gone out the door. The kits are TAPR's only source of income. An extremely small amount of each $240.00 goes into our fund for future development. I have forgotten how much. A number that does come to mind is the cost of the cabinet kit. Your cost, $69.00, our cost, $67.00. Our original goal was to make packet available to a large number of people at reasonable cost, delivering as full a function device as we could. It is possible to deliver less function for less cost. It is possible to deliver the same function assembled, tested, and warranted, for a larger cost. There are several market niches out there, and we will continue to ship as long as

1) there is a niche for us and
2) we're having a good time.

"Are we having fun yet? You bet!

"One final note. A for-profit company would be crazy to discuss future products like this before the product is ready to ship. But we're a nonprofit R&D company, trying to make packet the mode of the future. And remember, you saw it here first." Via HAMNET.

Club Listing

Here is a list of clubs active in Amateur packet radio.

Amateur Radio Research and Development Corp. (AMRAD)
P.O. Drawer 6148
McLean, VA 22106-6148

Amateur Radio Satellite Corp. (AMSAT)
P.O. Box 27
Washington, DC 20044

Chicago Area Packet Radio Association (CAPRA)
P.O. Box 8251
Rolling Meadows, IL 60008

Central Iowa Technical Society (CITS)
c/o Ralph Wallio, W0RPK
Rural Route 4
Indianola, IA 50125

Florida Amateur Digital Communications Assn. (FADCA)
c/o Ted Huff, K4NTA
1829 N. W. Pinetree Way
Stuart, FL 33494

Los Angeles Area Packet Group (LAPG)
c/o Harold Price, NK6K
1211 Ford Ave.
Redondo Beach, CA 90278

Minnesota Amateur Packet Radio (MAPR)
c/o Philip S. Plumbo, N0DFT
1128 Dayton Avenue
St. Paul, MN 55104

New England Packet Radio Assn. (NEPRA)
P.O. Box 15
Bedford, MA 01730

Rocky Mountain Packet Amateur Radio Assn. (RMPAR)
c/o Andy Freeborn, N0CCZ
52222 Borrego Drive
Colorado Springs, CO 80918

San Diego Packet Group (SDPG)
c/o Mike Brock, WB6HHV
10230 Mayor Circle
San Deigo, CA 92126

Tucson Amateur Packet Radio Corp. (TAPR)
P.O. Box 22888
Tucson, AZ 85734

Vancouver Amateur Digital Communications Group
(VADCG)

9531 Odin Road
Richmond, BC V6X 1E1
CANADA

Remember to include an s.a.s.e when writing to any of these clubs. Club money spent on postage is money that can't go into packet-radio development.

We also know of the following individual who would like to form a packet-radio club:

Doug Baker, K4CLE
8724 Cumbernauld Circle
Germantown, TN 38138

Voice Nets Concerning Packet Radio

The following voice nets are devoted to discussion of packet radio.

Day	Time	Frequency	Coverage	Sponsor
Mon	2000 PDT	145.36	Los Angeles	LAPG
Tue	2100 PDT	144.76	San Diego	SDPG

Would anyone out there happen to have a program or even an algorithm for computing the (absolute or relative) position of a satellite at a particular time, given the Keplerian orbital elements? I'd appreciate a copy of it, if that's possible. If there seems to be a demand for it, I'll post a copy to the net (if I ever get one! :-))

Thanks in advance!

I am planning a trip to Jamaica in December and was wondering if
anyone on the net knows of Two Meter repeaters on the Island. I
would also be interested in knowing if they have reciprocal
operating arrangements with the USA and if there are any problems
with customs on getting a hand-held in and out of the country.
Thanks -

******GRAND OPENING******

Tucson Amateur Packet Radio (TAPR) is proud to announce the opening
of their Headquarters. The office will be open from 8:30 A.M. to
5:00 P.M. Mon thru Fri. The group's first full time employee will
be on hand to answer the phone and run the organization's daily chores.
If you can't wait to get a TNC kit simply call Karen at the number below
with Visa or Master Charge and it will go out same day UPS!!! This is
a big boost for TAPR as it will help to speed up the turn around time on
correspondence. TAPR main P.O. box will still be used and all mail
should be sent there as usual. If you get a chance take a minute to give them
a call and say hi!
-Pete-

GATEWAY: The ARRL Packet-Radio Newsletter
Issue 1
Electronic

WELCOME

Welcome to Gateway, the ARRL packet-radio newsletter. Some of you reading this are deeply involved in amateur packet radio, some of you are just getting started on this exciting new mode, and some of you aren't quite sure what "packet radiolocal VHF networks will use gateways to connect to an international packet-radio network. We have called this newsletter Gateway because we hope that it will, like a gateway station, facilitate communications between amateurs interested in packet radio.

Gateway will not be a technical newsletter; there are already several fine packet-radio newsletters covering technical issues. This will be a "news" newsletter. At ARRL Headquarters we have many sources of news not all of which are available to each of you. This newsletter will bring together notes from these sources. Overseas and domestic packet-radio club newsletters, the FCC, the IARU, on-line conferences and on-the-air bulletin boards will contribute. You may see items that you've seen elsewhere, but you should also see things that are new and interesting.

Some of you are receiving this packet-radio newsletter and have never even considered what packet radio can do for you, or what fun you could have on packet. We hope to provide you with an overview of the state of amateur packet radio, explaining what

is being done and what can be done on this new mode.

It seems as though every packet-radio club is undertaking some project that will advance amateur packet radio. To make these projects fruitful, we must make the most of the limited resources available to amateurs. By telling a large audience about various packet-radio development efforts, Gateway should help organizers direct their efforts, and help volunteers find the groups that need them.

Perhaps when there is a worldwide amateur packet-radio network there will be no need for packet-radio newsletters. Until then, we hope that Gateway informs and interests you.

PACKET METEOR SCATTER

Last weekend's Persieds meteor shower provided a good opportunity to experiment with packet-radio meteor-scatter operation. Rich Zwirko, K1HTV, set forth some experimental guidelines, and stations throughout the U.S. attempted MS QSOs.

On August 1, well before the peak of the Persieds, W0RPK, the station of the Central Iowa Technical Society, held schedules with Bob Carpenter, W3OTC, in Maryland. The skeds were on 6 meters. Bob received about 2% of the packets sent from Iowa. Four nights later, again on 6 meters, W3OTC and W0RPK had what is believed to be the first amateur packet-radio meteor-scatter QSO.

As the Persieds approached, stations tried their luck on the 2-meter band. Stations in the East included K1HTV; Vern Riportella, WA2LQQ; Tom Clark, W3IWI; Hank Oredson, W0RLI; and Mark Wilson, AA2Z. In the West were Ralph Wallio, W0RPK; Bob McCaffrey, K0CY; Ron Dunbar, W0PN; Mike McQuiston, WA0WYW; Bob Schiers, N0AN; and Terry Van Benschoten, W0VB. Several of these stations copied beacons and connect requests via MS. On the morning of August 12, during the peak of the shower, W0RPK and K1HTV completed the first packet MS QSO on 2 meters. Congratulations are in order for all stations involved in these tests, and I hope that I haven't left anyone out.

These tests were performed at 1200 bauds, using AFSK FM. While it was necessary to use this mode in order to include as many stations as possible in the experiments, a performance sacrifice was made. We should organize further tests at higher transmission rates with more efficient modulation techniques.

ARRL APPOINTED IARU PACKET CENTER

The ARRL has been appointed IARU packet radio "information clearing house." The following is exerpted from the minutes of the IARU meeting in late July: "ARRL is nominated as the international clearing house of information relating to packet radio on behalf of the IARU, with a view to encouraging common standards and regulations."

This points the way toward international understanding and acceptance of packet radio standards generated in the United States and Canada. Several European amateurs have hesitated to get involved in packet radio because they were not sure which standards would "catch on." The appointment should help to alleviate this confusion abroad as to what is really happening in North American packet radio.

PACKET RADIO ON NETWORK TV

On July 16 at 0745 PDT, a packet from N6ECT was heard throughout the nation on the CBS Morning News show. Curtis Spangler, N6ECT, was being interviewed by CBS for a piece on the Haight/Ashbury and the film crew focused on his CRT. As luck would have it, Curtis was transmitting packets through the KA6M digipeater. The audio from one of the packets came through loud and clear, and the frame was heard in all 50 states and throughout half the world! Via KA6M.

220 MHz and PACKET RADIO

The 220-MHz band is crucial to packet radio for a couple of reasons. Because it is the lowest frequency band on which we can exceed 19,600 bauds, it is going to be used for the initial high-speed intercity linking. It is not being used for any satellite uplinks or downlinks, and so it is essential for full-duplex teleport stations. With these considerations in mind, we note the following:

The Tri-State Amateur Repeater Council has coordinated a 100-

kHz channel from 220.5 MHz to 220.6 MHz for wideband digital communications. This council coordinates VHF frequencies in northern New Jersey, southwestern New York (including Long Island) and Connect This petition calls for the FCC "to explore the potential use of vacant spectrum in the UHF TV bands, spectrum allocated for Fedral Government use, or assignments from the band 220-225 MHz to satisfy the requirements of land mobile users." This may sound worse than it is, since the petition goes on to say "Because of the limited number of channels that the 220-225 MHz band will provide, however, it is not anticipated that this spectrum can meet the immediate requirements of land mobile licensees."

Another petition (RM 4831), from a manufacturer of amplitude compandored sideband equipment, explicitly requests reallocation of the band 216-225 MHz. This petition poses a serious threat to the 220-MHz amateur band.

Packet radio needs the 220-MHz band. Be sure to read these petitions and send your comments to the FCC. The comment procedure was outlined in QST, March, 1982. The comment deadline for these two petitions is August 29, 1984.

WHAT'S BREWING AT TAPR?

This piece came from Harold Price's answer to the question "Is TAPR up to something?" Harold is part of the TAPR software design team, and he made these comments while he was "Member of the Month" on Compuserve's HAMNET.

"The following views are mine alone, and do not necessarily refect those of TAPR, AMSAT, VITA, LAPG the staff, management, or janitorial departments.

"The TAPR folks are indeed up to something. We have the TAPR Pascal code running happily under a simulated environment again. The software, with only one change, runs under TURBO Pascal on the Pronto-16. This will vastly speed up development, which has slowed down as of late.

"The plan is to come up with version 4.0 of the TAPR TNC software which will allow testing of both datagram and virtual connection protocols. I think the level two wars are over. With 1300 TNCs in the field from 6 "manufactuers" all running the same level two, anyone proposing a switch now is just rocking the boat. The few proposals I've seen for different level twos offer no concrete advantages over what we've got now anyway. Besides, level two is boring (now that we have one that works). The real

fun is level three.

"For the newcomer, level two refers to a point to point protocol, linking one TNC to another with no TNCs in the middle. There is currently a necessary kludge in AX.25 called digipeating which is a very demented level three feature. Digipeating allows two TNCs to be connected using a third as a relay. Without this simple addition to AX.25, packet may not have taken off as it did, since digipeating allows many more users to reach each other. If you haven't got a wide-coverage duplex repeater (or even if you have), digipeating is your best bet for now.

"Anyway, level two is point to point, with level two+ in current style, multihop dumb repeating. The + in level two will die a happy death when we get level three up and running. Level three links two end points thru multiple intermediate TNCs. The linking is done in an intelligent manner. ACKing is node to node rather than end to end. In level two digipeating, each intermediate point simply regenerates the packet. It does not

ACK it. The final end point ACKs it, and the ACK is blindly repeated back to the starting point. If any repeat of the packet, or the ACK, is stepped on or dropped, the packet must start over from the beginning.

"In level three, an ACK can occur at each step of the way. Thus, a packet may only have to be re-sent between relay points five and six, rather than starting again at point one. So why don't we get on with it, you might ask?

"There are many problems involved in design and implementation of a level three network -- flow control, network blocking, routing, on and on. What is TAPR doing?

1) A node in a level three network will want to be connected to more than one other node. We will allow the TAPR TNC to maintain multiple level two connects. This has several implications. First, you can carry on two or more concurrent conversations. Not so good for rag chewing maybe, but great for emergency communications. Imagine a TNC in the local disaster center. Currently you can carry on a conversation with only one other TNC, with limited possibility of a priority break-in from another TNC. With all outlying TNCs connected to the central node at the same time you get closer to what you want, high reliability connections with each of the field guys at the same time.

"Next, and even better, you can automatically route one connection stream to another. Maybe an example is called for. The syntax below is probably not what we'll end up with, but the idea is:

```
 MYCALL NK6K
 [1] CONNECT WB6YMH
```

```
     [1] CONNECTED TO WB6YMH
 [2] CONNECT WA6JPR
     [2] CONNECTED TO WA6JPR
 ROUTE [1] TO [2]
```

"Your TNC is now a network node. Anything that comes in from stream [1] gets ACKed at level two. The data from the packet gets routed to stream [2] where it gets sent out and saved until an ACK comes in on stream [2]. The reverse is also true, incoming from [2] goes to [1].

"Now, wouldn't it be great if you could cause the other guys board to make a connection? If I could tell WA6JPR to make a level two connection to WB5EKU? Then what we have is the level three function, endpoints linked thru multiple intermediate points. A lot of things are missing, but this simple mechanism allows testing of level three concepts without a lot of hassle on the users part. We will also design an interface (based on asyncronous LABP) between the TNC and its attached computer to allow the computer full control over the link process. This permits the use of the TAPR TNC as a level two black box, with level three functions done in your host.

"Do I expect everyone to run verson 4? Well, why not? Version 3.1 can still be used point to point, and thru 4.0 gateways get full access to network. But just as everyone having the capability of being a digipeater added to the swift growth of packet, so will the ability of each TNC to be a level three node.

"But I ramble. Not only does a network node need to support multiple level two connections, it might also need to support connections on multiple RF channels. Let's assume a 1200-baud link on 2 meters and a 2400-baud link on 220, feeding a 9600 baud link on 440. The hardware arm of TAPR is designing a fancy multiport hardware controller. Several designs have been proposed, including a motherboard with slots for plugging in a number of channel-controller cards. Each channel-controller card is a mini TNC, handling all channel-access and level two functions. The mother board passes data between channels and handles level three and higher functions.

"We don't expect everyone to have one of these TNC-LINKs (say "tink link"). But they will make great mountain-top controllers, especially when used with the PACSAT 9600 whiz-bang modem, which has been described elsewhere.

"How long do I see TAPR building kits? There are two answers: "As long as there is a demand" or "Until we can't stand the sight of them anymore." I haven't been pressed into the chain gang of kit packaging, but isn't much fun, especially when serial number 1000 has long since gone out the door. The kits are TAPR's only source of income. An extremely small amount of

each $240.00 goes into our fund for future development. I have forgotten how much. A number that does come to mind is the cost of the cabinet kit. Your cost, $69.00, our cost, $67.00. Our original goal was to make packet available to a large number of people at reasonable cost, delivering as full a function device as we could. It is possible to deliver less function for less cost. It is possible to deliver the same function assembled, tested, and warranted, for a larger cost. There are several market niches out there, and we will continue to ship as long as

1) there is a niche for us and
2) we're having a good time.

"Are we having fun yet? You bet!

"One final note. A for-profit company would be crazy to discuss future products like this before the product is ready to ship. But we're a nonprofit R&D company, trying to make packet the mode of the future. And remember, you saw it here first." Via HAMNET.

Club Listing

Here is a list of clubs active in Amateur packet radio.

White House Radios Prevent Eavesdropping

SANTA BARBARA, Calif. - The White House, irked that reporters and others eavesdrop on its communications when President Reagan is traveling, has turned to new high-tech radios that leave snoops listening to static.

When Reagan flew to California recently, his staff and security forces were carrying smaller, more sophisticated versions of the two-way radios they use to case the problems of presidential travel.

Until these new radios were brought in, news agencies and others could monitor the White House frequencies to keep track of the President's movements and quickly detect any sign of trouble.

The practice is legal but White House officials were angered last fall when reporters heard - and recorded - a radiotelephone conversation between Reagan and a gunman holding hostages at Augusta National Golf Club in Georgia, where the President was spending the weekend.

White House spokesman Mark Weinberg said the new "encrypted radios" use technology that codes a radio transmission as it comes over the wire so it can be understood only by radios that have the same equipment.

Anyone else receiving the coded transmission hears only static, and for additional protection the codes are changed from time to time.

In the S.F. bay area, Premier Channel is attempting to eliminate the unsubscribed reception of their HBO broadcasts via the MDS service. (2152 MHz) They hired college students to drive all over the bay area looking for "suspicious" antennas, writing down the address, and sending these people (~18,000) a letter saying-

1) Take down your antenna.
2) Sign this form agreeing never to put it back up.
3) Send $300.00 as an "out of court settlement"

or be added to litigation for damages in excess of $1000.00.

Amateurs who contact the law firm sending the letters (addressed from a P.O. box, but postmarked from another city) are removed from any litigation.

The reason is that the grounds for the suit are based on section 605 of the Communications Act of 1934 which say it is illegal to receive private communications without authorization. In 1982 president Reagan signed a bill which, among other things, exempted radio amateurs from that (605) section of the act obstensibly to enable amateurs to police their own bands.

cbnap!gws   Aug 20 18:18:00 1984

A new full feature YAESU 2 meter HT is now out..

     The local candy store now has a demo model of the YAESU FT 209
full feature 2 meter handheld. Its kind of a cross between the KENWOOD
2500 KENWOOD 2600 and YAESU 208. It has a 5 watts plus power output
with a standard slip on battery pack (ala 2500). A large keypad lets
enter frequency and functions and a very large LCD display shows all
function and states that the the rig is in. Some improvements over the
FT 208R is that the transmit offset is now stored with the recieve
frequency an optional PL frequency can also stored. A much need reverse
switch is now included. A combination transmit/recieve/battery analog
meter lets you keep track of your rig. The best thing I noticed is that
the audio is very clean as well as being louder, (many 208 users have
noticed that the audio level is very low). A "maybe" feature is a vox
operated mic, much like that of the YAESU FT 203. Some of the bad things

I have found is that none of the 208/708 options will be compadable with the
new 209. I had only had a short period of time to play with the unit,
but with this town being very "PRO" YAESU i will probably be seeing
and hearing may of the units on the air. Anyone got one yet, comments??????

x
Three comments:

1. The optional PL deck available for this new Yaesu will
be encode/decode.

2. The soft vinyl case is much like a thin glove. It
takes a while to remove the radio from this case.

3. As more and more chip components are used in
these
newer radios, the price and size are being reduced,
but home repair will become much more difficult.

Anyone have any experience hooking up a FT101ZD to a Microwave Modules
MMT-432/28s transverter. The transverter should put out 10 watts but I
get a max of about 7 watts (after tweaking the pot inside the transverter).
I suspect the 101 isn't putting out the 3 volts rms that's claimed in
the manual.
Anyone done it and got 10 out of the transverter??

Anyone know the coding method they use ? I hope not the old
balanced modulator scheme that a lot of police departments use.

I've never listened to them, I'm just curious how they work...

hr crrl bulletin nr 26 from crrl headquarters
london ont august 14 1984
to all radio amateurs bt

doc has issued a new proposed spectrum utilization policy for
the 890 to 960 mhz band in addition to the present usage of
the 902 to 928 mhz portion using a3 or f3 only, other emissions
would be allowed. if the new policy is adopted, there will be
one condition for amateurs. they will have to contact a doc
district office before beginning to transmit on this band, to
ensure that their transmissions will not interfere with the
primary users of the band.

doc will hold amateur radio exams across canada on october 17.
if you plan to write, apply to doc by september 19. the next
examinations will be on february 13.

ve6vw is the new manager of the crrl ve6 incoming qsl bureau.
the new bureau address is general delivery morinville, alberta
t0g 1p0.

the new canadian representative on the arrl repeater advisory

committee is ve3gyq ar

hr propagation forecast bulletin nr 34 from arrl headquarters
newington ct august 20, 1984
to all radio amateurs bt

the solar flux fell steadily after august 10, reaching a low of 74 on the 19th. the curve was similar to that for the same point in the previous solar rotation four weeks ago. the low of 74 was last reached on july 20, but we have to go back to july 1977, to find solar flux levels that low. only slight flux changes are expected until early september.

we are presently at the seasonal low point of the year for f layer useable frequency in the northern hemisphere. the daily muf will be rising slowly during the balance of august. high latitude propagation is reappearing on 21 mhz and 28 mhz will be coming to life in early september. the seasonal peak will come in late october with optimum conditions on all dx bands prevailing through early december. f layer dx on 50 mhz is unlikely for the balance of solar cycle 21.

geomagnetic disturbances and generally poor propagation on all dx bands are expected august 24 through 26 and 28 through 31.

american sunspot numbers for august 9 through 15 were between 15 and 32 with a mean of 25.1 ar

Subj: Uo-9 bulletin 88

**** UoSAT Bulletin-88   17th August 1984 ****

** UoSAT-Oscar-9 Schedule **

The daily operations of UoSAT-1 will continue to be disrupted next week, and this Bulletin will be transmitted, together with 1200 bd telemetry and Digitalker, until Wednesday - to be followed by check-summed telemetry. The preparation of the Bulletin is being re-organised to spread the workload - please bear with us!

Items of relevant interest for the Bulletin are always welcome - the weekly deadline is 10.30 local time each Friday - and should be sent to the UoSAT Team in writing.

The 2.4 GHz Beacon will be in use this week.

** General News **

Martin (G3YJO), Roger (G8NEF) and Tony (G8ONO) visited ESTEC (ESA) on Monday, Tuesday & Wednesday this week to give presentations on the UOSAT Programme and to discuss possible future collaboration and use of their facilities. The meeting was most profitable and interesting.

A Masters Degree in 'Satellite Communications Engineering', based heavily around the experience gained through the UoSAT Projects, will commence at the University of Surrey this October - although welcome, this adds, however, to the already overloaded UoSAT Team! Details avaliable from G3YJO.

Future UoSAT Missions are being proposed and studied, varying in scope from UO-9 & UO-11 orbits to Phase 111 and Geosynchronous orbits. We would be very interested to hear of any (reasonable!) suggestions or areas of interest that you may have - again please direct to G3YJO.

Three Active Magnetospheric Particle Tracer Expt. (AMPTE) spacecraft were launched successfully by NASA DELTA from Cape Canaveral on Thursday 16th August - after three aborted launch attempts following ground station computer malfunctions and the discovery of debris in the vehicle. A small UK spacecraft, contributed by the UK SERC, was mounted between the two large US & DL spacecraft - UoSAT contributed to the Particle Wave Experiment on this s/c.

** UoSAT-Oscar-11 Operations **

Harold Price, NK6K, has continued his efforts to commission the Digital Communications Experiment (DCE).

Whole-orbit data gathering has continued, interspersed with telemetry, to support analysis of the GG lock and libration.

The frequent dumps of data from the ODATA whole-orbit telemetry recording program indicate that the gravity-gradient lock is stable, and analysis now indicates that the libration (oscillation about the ideal downward-pointing direction) is currently contained within a 20 degree cone and with a very long period - of the order of hours. The simulations carried out at UoS before GG boom deployment indicated that we might expect about 38 to 42 degrees of libration, so this result is particularly pleasing. Work is now under way to consider spinning the spacecraft slowly (once every 5-10 mins) in order to improve the temperatures and also to develop de-libration algorithms to improve further the earth pointing. 'Thermal spin' manoeuvres are planned to commence next week.

A number of CCD Imager tests have been carried out (Thurs & Fri) - results will take some time to process, but will be announced a.s.a.p.!

** UOSAT-OSCAR-11 Gravity Gradient Boom Deployment **

Following several days final preparation and rehearsals, the UO-11 gravity gradient boom was deployed under on-board 1802 computer control at 10:35 gmt during orbit 2113 on 24th July.

The automatic magnetorquing manoeuvres, continuously executed by the 1802 OBC over the previous few weeks, had aligned the spacecraft closely to the geomagnetic field vector and reduced residual motions (wobble) to a very low value. Following final confirmation of auspicious deployment conditions at AOS at Surrey on orbit 2113, the OBC was given instructions to terminate the magnetorquing routines and deploy the boom for 15 minutes taking the spacecraft out of range of UoS. The OBC simultaneously recorded X,Y,Z, +5V current and boom & computer status channels automatically throughout the operation whilst the boom was being deployed and during the following orbit, to monitor gravity gradient capture and spacecraft operations.

The stored data was dumped at UoS on the next orbit (2114) and examination confirmed the correct operation of the deployment routine and preliminary analysis of the stored Navigation Magnetometer data indicated successful gravity gradient capture.

Data gathered regularly since then has confirmed that the spacecraft has maintained successful gravity gradient stabilisation and showed no evidence of severe libration. Residual energy before boom deployment translated itself into libration following GG-lock - which has been monitored and will be minimised using magnetorquing routines similar to those used during initial attitude control manoeuvres. The spacecraft

will soon be spun very slowly around the Z-axis in order to improve the internal temperatures - currently running somewhat cool. Introducing a very slow Z-spin does, of course, interact with the GG stabilising forces but only to impart a small forward or backward 'tilt' of a few degrees dependent on spin rate.

Gravity gradient stabilisation of UO-11 is the culmination of many months of preparation and many weeks of spacecraft activities - most of which has not been visible to the outside world! It has been very demanding and has necessitated the use of considerable facilities and required a particular, dedicated effort from the UOSAT Team - particularly Stephen (Attitude, Stabilisation & Navigation Analysis), Roger G8NEF (Spacecraft Software) and Neville G8NOB (Ground Station Software).

Deployment 'highlights' follow:

Saturday 21/7/84

TORQUEH (the 1802 program which actively controls the magnetorquers in conjunction with reading the navigation magnetometer, records and replays whole orbit data and runs command timing loops) was further exercised as well as re-initialising its ODATA function at 21:29:40.

Monday 23/7/84

Morning - tests of final ground "deployment decision" software were made by switching the magnetometer on permanently and watching the fields changing. Residual oscillations of under 10 degrees were encouraging.

Evening - A full rehearsal of the boom deployment operation was run over 3 passes. The boom deployment commands were substituted by commands which were equally visible on the telemetry status points but otherwise harmless! After the ODATA was dumped, active magnetorquing was re-enabled.

Tuesday 24/7/84 - Boom deployment

Orbit 2112 - While holding the telemetry system in dwell mode (which prevents ODATA from recording since all channels are not found), the TORQUEH ODATA segment was reset, and active magnetorquing resumed. The spacecraft was left until LOS transmitting dwell telemetry to the ground analysis software.

Orbit 2113 - Sending one command told the 1802 to turn the z-magnetorquer on continuously, to allow the ground software to take a precise fix of the spacecraft attitude. After about 3 minutes of data, Stephen finally confirmed a suitable attitude, and the telemetry system was switched out of dwell mode to enable ODATA recording to start at 10:35:00 (approx). The

channels recorded were 1,2,3,41,61,67. The last two record hexadecimal numbers - sorry if your ODATA program expired at this new facility!

At 10:35:20, a command to the 1802 turned the boom motor on for a 15.0 minute deployment and we watched the telemetry anxiously. An anomaly on the 5v current sensor prevented us seeing the true current, but the 14v bus was as expected and the motor was left running as the spececraft disappeared below our horizon.

Orbit 2114 - Telemetry at AOS looked good, with the boom motor off and a good battery voltage. After taking the stored ODATA dump, the magnetorquers were disarmed and ODATA was reset at 12:19:23 to record channels 1,2,3 and 52. The real-time dump of the ODATA looked most encouraging.

By the evening, the next ODATA dump to be analysed confirmed a stable gravity gradient lock. More rapid dumps (always using channels 1,2,3,52) were made after resets at 18:37:53 and 20:09:45.

Friday 27/7/84

The 2.4GHz beacon was tested and found to be much improved in the new attitude. This downlink should prove to be very useful for engineering and high speed data for ground stations which are well-equipped with good receiving and decoding equipment.

** UO-11 Mission Plan **

Gravity gradient stabilisation marks the end of the major spacecraft commissioning phase of UO-11 and now allows us to progress with the commissioning of the experiments. This will commence with evaluation of the DCE and CCD Camera, however a more detailed Plan will be available shortly.

** NOAA Spacecraft Status Update **

* NOAA-8, the first in a series of Advanced TIROS-N spacecraft, began exhibiting problems on June 12 when it experienced a 'clock interrupt' that caused the spacecraft's gyros to loose synchronism. Continued clock perturbations interfered with the meteorological instruments on June 13th. Over the weekend of June 30/July 1, the situation deteriorated to the extent that the spacecraft's attitude control systems were affected and NOAA-8 began tumbling. The spacecraft has no nitrogen attitude control fuel left after remedial manoeuvres following launch on March 28, 1983 aboard an ATLAS-E launcher. NOAA-8 weighes 3,775 lbs and carries six environmental monitoring instruments and a search-and-rescue experiment. Although the search-and-rescue facility will be lost if NOAA-8 cannot be recovered, much of the environmental monitoring is being

conducted by NOAA-6, still operational since launch on 27 June 1979.

Engineers are working to resolve the problem before the launch of NOAA-F, currently scheduled for 23 October 1984.

* NOAA-7 will complete its planned operational lifetime this summer, but is continuing to perform well.

** Thanks for Reports & Questionnaire Returns **

Most of the new systems feed digitized audio through DES chips, and thus are "relatively" secure. How secure in REALITY depends on how far you trust DES.

Does anyone know any of the following about the transverter output
in the Kenwood 930?:

     Frequency. (looks like it is off a broadband driver and
               would be any freq selected).

     Impedance.

     Level.

Tnx Bob K9EUI

To facilitate official-looking comments to the FCC, could somebody put a
"blank form" for the purpose on the net? Or an example comment?
I once had such a form in electronic form which I used for the no-code
filing, but it has been zapped in the meantime.

You know,

```
           (
           (
           (                      or whatever
In the matter of  (
           (
           (
           (
```

Any help in reconstructing the proper format will be appreciated.

```
                       73,
                       W3IKG
```

:-)
I bet you all thought I left. Anyway, there apears to be some
comotion about loosing 220? What do you expect! Use it or loose
it! Just because you have a repeater that emits morse code and
collects static doesn't mean you are a spectrum user. I still think
amatuers should stay below 30 MHZ where Morse code is supreme and
leave the VHF and up to the people who can use it more effectively.

JEEZUS H CHRIST!!!!

This is the second time you've posted a 1400 line document full
of total garbage!

Of course you work for a phone company, so our phone bills don't bother
you. Just for an exercise, figure out what it cost the 11 sites in the
path to send this piece of sh*t, then multiply that by 99 for the 1000
sites on the net.

Kindly find some dark hole somewhere and seal it behind you.

At first I thought the original complainer from xeroX was overreacting.
I now see that his reaction was overly mild.

x
  In a recent telephone conversation, Bob Grove passed on this
  note of interest:

        The two-way radio headsets that CBS announcers and
        reporters use transmit on 462.650 MHz.

  These headsets are quite noticeable in the coverage of the
  current political conventions as well as sporting events.

Thanks to all of the replies from my question about the White
House Security Radios that are not "receivable" with a conventional
scanner.   Most replies suggest that they are using a Motorola
system that employs the DES algorythm or a similar method developed
by Motorola.   I built a simple circuit years ago to listen to
a local Police department that used a speech inversion scheme. That
turned out to be quite simple to defeat. This appears to be quite
secure and for all practical purposes, extremely difficult to
impossible to decode, without the key /etc.   Sorry I didn't thank
everyone personally, but I don't have access to arpanet, where several
of the replies came from.   Thanks !!......Dave Chasey -- wn9nbt

Spread Spectrum communications could be used. Even if one were close enough to the transmitter to detect RF, it would just sound like static on an ordinary receiver. Most of the time, the signal would be substantially below the noise-- again, static received.

HOW TO PREPARE COMMENTS FOR THE F.C.C.
_____

Comments to the FCC should be on 8 1/2 by 11 inch paper with the left-hand and top margins being at least 1 1/2 inches and at least one inch on the right side and bottom of the page. Use one side of the paper only and double-space your comments, except for long quotations, which may be single spaced. All papers shall be typewritten. Number your paragraphs and in your comments, refer to the docket paragraph number or rules Part number that you are commenting on.

Be polite and don't insult the Commission. Don't say "don't do" something unless you have an alternative to offer, or can list reasons why it should not be done.

Mail the original and 5 copies to:

Federal Communications Commission
Mr. William Tricarico, Secretary
1919 M. Street, NW.
Washington, D.C. 20554

The top of the first page should be headed as in the following example:

Before the

**** UoSAT Bulletin-89 24th August 1984 ****

** General News **

* Future UoSAT Missions are being proposed and studied, varying in scope from UO-9 & UO-11 orbits to Phase 111 and involvement in Geosynchronous orbits. We would be very interested to hear of any (reasonable!) suggestions or areas of interest that you may have - please direct to G3YJO.

One such future mission possibility being considered is the use of an ARIANE-4 launch to place a constellation of six (or maybe cut down to three) small amateur satellites into geosynchronous orbit. The spacecraft would be transferred into geosynchronous orbit by a common 'carrier' module, ferrying the spacecraft through the drift phase of the orbit and then depositing them, two at a time, at positions around the equator. It is proposed that each spacecraft carry at least a MODE-L transponder. A project of this scale would clearly have to be undertaken by a international AMSAT team , probably US/DL/UK and each group would also furnish additional experiments in keeping with their interests. This is an ambitious idea (and costly) but could advance amateur radio communications by a further quantum leap, however it is early days yet and this scale of mission may not prove practicable or even desirable. What are YOUR thoughts?

* A Masters Degree in 'Satellite Communications Engineering', based heavily around the experience gained through the UoSAT Projects, will commence at the University of Surrey this October - although welcome, this adds, however, to the already overloaded UoSAT Team! Details again avaliable from G3YJO.

* Three Active Magnetospheric Particle Tracer Expt. (AMPTE) spacecraft were launched successfully by NASA DELTA from Cape Canaveral on Thursday 16th August - after three aborted launch attempts following ground station computer malfunctions and the discovery of debris in the vehicle. A small UK spacecraft, contributed by the UK SERC, was mounted between the two large US & DL spacecraft - UoSAT contributed to the Particle Wave Experiment on this s/c. The spacecraft have been in orbit over a week now and are reported to be functioning very well.

** UoSAT-Oscar-9 Schedule **

The Bulletin/Digitalker/Telemetry on UoSAT-1 will run through to Wednesday 29 August due to a UK national holiday on Monday and a UoS holiday on Tuesday! It is hoped that a more normal service will resume soon on UoSAT-1. The preparation of the Bulletin is being re-organised to spread the workload and items of relevant interest for the Bulletin are always welcome - the weekly deadline is 10.30 local time each Friday - and should be sent to the UoSAT Team in writing.

We have received a suggestion that it might be useful to include line numbers in the Bulletin. This would be useful for those using comuters to gather the Bulletin as it would allow them to assemble a complete Bulletin from noisy data on multiple orbit passes without manual editing. This feature would, however, reduce the space available for text - what are YOUR thoughts please!

Special 'Notice Board' items for demonstrations/displays using UoSAT are also welcome as they can add 'interest' to such activities.

The H.F.Beacons Expt. will be in use this week.

** UoSAT-Oscar-11 Operations **

Harold Price, NK6K, is continuing his efforts to commission the Digital Communications Experiment (DCE).

Several whole-orbit data formats have been gathered last week - interspersed with telemetry - to support analysis of the GG lock and libration. A daily account follows:

```
 Saturday - #2479, channels 1,2,3,52 reset at 11:49:30
            #2484, channels 1,2,3,52 reset at 19:46:45

 Sunday   - #2498, channels 1,2,3,52 reset at 18:49:30

 Monday   - #2507, channels 1,2,3,52 reset at 09:48:25

 Tuesday -  #2521, channels 1,2,3,52 reset at 08:47:40

The frequent dumps of data from the ODATA whole-orbit telemetry recording program indicate that the gravity-gradient lock is stable, and analysis now indicates that the libration (oscillation about the ideal downward-pointing direction) is currently contained within a 20 degree cone and with a very long period - of the order of hours. The simulations carried out at UoS before GG boom deployment indicated that we might expect about 38 to 42 degrees of libration, so this result is particularly pleasing.

UO-11 is now spinning about once every 4 minutes around the z-axis in order to minimise the temperature gradients across the spacecraft. The spin has not affected the GG lock but has introduced some more complex motions which are currently being analysed. The spacecraft spin rate will be increased slowly to evaluate the interaction with GG lock and to study thermal effects. The effect of the z-spin can be seen clearly in the whole-orbit navigation magnetometer data ('wrinkles' on the z-data & modulated oscillations on the x,y-data) and also quite easily by observing the solar array currents on real-time telemetry.

The CCD Imager tests carried out (Thurs & Fri last week) are still being analysed - the results will take some time to process, but will be announced a.s.a.p.!

** UOSAT-OSCAR-11 Gravity Gradient Boom Deployment **

Following several days final preparation and rehearsals, the UO-11 gravity gradient boom was deployed under on-board 1802 computer control at 10:35 gmt during orbit 2113 on 24th July.

The automatic magnetorquing manoeuvres, continuously executed by the 1802 OBC over the previous few weeks, had aligned the spacecraft closely to the geomagnetic field vector and reduced residual motions (wobble) to a very low value. Following final confirmation of auspicious deployment conditions at AOS at Surrey on orbit 2113, the OBC was given instructions to terminate the magnetorquing routines and deploy the boom for 15 minutes taking the spacecraft out of range of UoS. The OBC simultaneously recorded X,Y,Z, +5V current and boom & computer status channels automatically throughout the operation whilst the boom was being deployed and during the following orbit, to monitor gravity gradient capture and spacecraft operations.

The stored data was dumped at UoS on the next orbit (2114) and examination confirmed the correct operation of the deployment routine and preliminary analysis of the stored Navigation Magnetometer data indicated successful gravity gradient

capture.

Data gathered regularly since then has confirmed that the spacecraft has maintained successful gravity gradient stabilisation and showed no evidence of severe libration. Residual energy before boom deployment translated itself into libration following GG-lock - which has been monitored and will be minimised using magnetorquing routines similar to those used during initial attitude control manoeuvres. The spacecraft has now been spun slowly around the Z-axis in order to improve the internal temperatures - previously running somewhat cool. Introducing a slow Z-spin does, of course, interact with the GG stabilising forces but should only impart a small forward or backward 'tilt' of a few degrees dependent on spin rate.

Gravity gradient stabilisation of UO-11 is the culmination of many months of preparation and many weeks of spacecraft activities - most of which has not been visible to the outside world! It has been very demanding and has necessitated the use of considerable facilities and required a particular, dedicated effort from the UOSAT Team - particularly Stephen (Attitude, Stabilisation & Navigation Analysis), Roger G8NEF (Spacecraft Software) and Neville G8NOB (Ground Station Software).

** UO-11 Mission Plan **

Gravity gradient stabilisation marks the end of the major spacecraft commissioning phase of UO-11 and now allows us to progress with the commissioning of the experiments. This will commence with evaluation of the DCE and CCD Camera, however a more detailed Plan is being prepared.

** NOAA Spacecraft Update **

* NOAA-8, the first in a series of Advanced TIROS-N spacecraft, began exhibiting problems on June 12 when it experienced a 'clock interrupt' that caused the spacecraft's gyros to loose synchronism. Continued clock perturbations interfered with the meteorological instruments on June 13th. Over the weekend of June 30/July 1, the situation deteriorated to the extent that the spacecraft's attitude control systems were affected and NOAA-8 began tumbling. The spacecraft has no nitrogen attitude control fuel left after remedial manoeuvres following launch on March 28, 1983 aboard an ATLAS-E launcher. NOAA-8 weighes 3,775 lbs and carries six environmental monitoring instruments and a search-and-rescue experiment. Although the search-and-rescue facility will be lost if NOAA-8 cannot be recovered, much of the environmental monitoring is being conducted by NOAA-6, still operational since launch on 27 June 1979.

Engineers are working to resolve the problem before the launch of NOAA-F, currently scheduled for 23 October 1984.

* NOAA-7 will complete its planned operational lifetime this summer, but is continuing to perform well.

** Thanks for Reports & Questionnaire Returns **

> In California the 220 mhz spectrum is used quite extensively. There hundreds of repeaters in use that occupy all of the allocated repeater spectrum, and 90% of these repeaters are used often. Not just sounding their id'er (which happens to be illegal). There are emergency services and nets on this band just as there are on the bands below 30MHZ. Vhf serves it purposes for local communications and works well when integrated with hf for emergency communications. I would like to see you carry a 520S with a key on your hip while you are hiking up a mountain searching for a lost hiker. And I'm sure those people half way across the the world would also like to hear about the walkathon your working on. I think that covers it for now. I know I will hear from you soon.

_I_n_t_r_o_d_u_c_t_i_o_n

The growth of digital communications in the amateur radio service during the past few years has been nothing short of incredible. More than anything else, the ready availability of digital packet communications using sophisticated packet controllers such as the Vancouver [VADCG], Tucson [TAPR], and GLB devices has introduced packet communications to many hams who would not otherwise have become involved in digital communications. Beyond these packet controller's function as sophisticated replacements for mechanical teleprinters, they provide a means for the estab-

lishment of message systems and bulletin boards by permitting direct connection to personal computers.

While some use of packet radio has been made on the HF bands below 30 MHz at lower data transmission rates, the greatest activity is currently on VHF-FM (particularly 2 meters). Since dependable VHF communication is limited to (at most) a hundred miles or so from one home station to another, the number of stations that can be contacted by packet radio is somewhat limited.

_R_e_p_e_a_t_e_r_s _a_n_d _D_i_g_i_p_e_a_t_e_r_s

Since the digital transmissions are converted to and from audio signals using standard modem technology, it is possible to send packet transmissions through ordinary voice repeaters. There are both technical and social problems with this practice, however, which make it unwise to do so.

Technically, many voice repeaters have audio response characteristics that, while not really noticeable with voice transmissions, introduce significant distortions that reduce the reliability of digital retransmission. Additionally, Morse code or voice identifiers, frequency or signal

_____
Much of the work in this paper is the direct outgrowth of continuing discussions with Mike Brock, WB6HHV and others in the Southern California packet radio community.
Author's current address:
Brian Kantor, Computer Center C-010, UCSD, La Jolla, CA 92093 [sdcsvax!brian -or- kantor@nosc]

strength telemetry tones, and `over' beeps all may be confused as packet signals by the less sophisticated packet controllers.

Socially, the harsh sounding modem tones generated by the packet equipment are annoying in the extreme for voice users, leading to jamming, interference, and general unhappiness. Also, many packet controllers recognize only packet

modem tones, so they do not acknowledge that a frequency is busy when it is occupied with voice transmissions, and may transmit on top of an existing voice conversation.

Digital repeaters, known as _d_i_g_i_p_e_a_t_e_r_s, provide a means for automatically retransmitting packet signals, but because packet acknowledgments must be returned from the far end of the connection over the possibly multi-hop link path, the effective rate of transmission is greatly decreased. Also, there is currently no collision checking when signals are digipeated. Thus, in case of a packet collision, current digipeaters cannot detect the collision and retransmit the packet that was destroyed by the collision. The originating station must therefore await the lack of acknowledgement from the far end of the connection and resend the packet. Repetition of sent packets from the originating station may very well occupy large amounts of a network's available transmission capacity.

_T_h_e _N_e_t_w_o_r_k _S_o_l_u_t_i_o_n

We feel that the solution to these problems lies in a dedicated network for packet communications, much like the packet switching networks that regularly move millions of characters of data across the country and around the world every day.

The network is simple. Each community (or geographic area) has at least one Packet Network Controller [PNC] to serve as a network _g_a_t_e_w_a_y which would be the access to the packet network for that area. These stations would function automatically, without a human operator, and would serve to provide connections for local and network users. Each PNC would have at least one neighbor PNC, and could make logical connections to and through the adjoining PNCs.

_T_h_e _S_t_r_u_c_t_u_r_e _o_f _t_h_e _N_e_t_w_o_r_k

AMPRNET[1] is structured as a mesh of PNCs, each having one or more neighbor PNCs to which it can connect via radio links. Each of these PNCs has connections to other PNCs, and so on, until all PNCs in the network are reachable

---

[1] Thanks to Hank Magnuski, KA6M for the network name.

through one or more hops. Connections between nonadjacent PNCs are made by having adjacent PNCs relay the packets between the two endpoints of the logical connection.

Every PNC has a routing table which describes at least one path to every other accessable PNC. By using this table, it is possible for any PNC to contact any other PNC, possibly through a number of intervening relay hops. The routing table is dynamically built and updated as the network topology changes with nodes coming in and out of service.

_T_h_e _U_s_e_r _V_i_e_w _o_f _t_h_e _N_e_t_w_o_r_k

A connection is established via the network in two distinct steps. First, a user connects to the local PNC. We have chosen the use of the ssid (station sub identification field) value 14 (fourteen decimal) as the reserved designator for PNC stations, so a connection initiated from (for example) a TAPR TNC might appear as

CONNECT WB6CYT-14

which would instruct your station to connect to the PNC run by WB6CYT. A `connected' message, followed by a `network ready' message would appear on your screen.

Next, you would instruct the PNC to attempt to connect to the station you wanted to call. In order to do this, you must know the identification of the PNC serving his area. So, for example, to contact Harold Price in Los Angeles, you might instruct the PNC to connect you to his packet station via one of the Los Angeles PNCs:

CONNECT NK6K@WB6YMH
(the -14 is implied here)

assuming that WB6YMH was operating that PNC. The network will take care of establishing the connection and all routing of packets necessary. When the conversation is finished, disconnecting from either end will cause the virtual connection over the network to be closed as well. Note that connections may be entirely local with only the local PNC involved; this provides a more reliable local-area repeated connection than current digipeater technology can.

We plan to have the PNC supply other services as well. Among those planned for are

_N_e_t_w_o_r_k _P_r_o_t_o_c_o_l_s

While there are many proposals to establish a standard protocol for linking of amateur packet stations, there currently are no experimental results showing a clear advantage for one choice over another.

The protocol chosen must take into account two different aspects of the network. First, there is the question of transport between nodes of the network, and second, the format of the data carried by the network. These are not necessarily solved by the same answer.

The _t_r_a_n_s_p_o_r_t protocol describes the method chosen to carry messages between nodes of the network. While for a hardwire line a simple serial ASCII link would be sufficient, for the more common radio links, a reliable means should be chosen. In our research, we found that the present implementation of the _A_X._2_5 protocol (used by TAPR, VADCG, GLB, and others) would serve well. It has error detection and correction, is efficient, and both software and hardware for its use are readily available. For these reasons, we have chosen to use the AX.25 protocol for most node-to-node radio links on the network.

The _A_M_T_O_R communications protocol also has some distinct advantages for links that are on the HF amateur bands. In cases where the links between network nodes are to span large distances, the AMTOR protocol could be used and we think it would serve well.

The format of messages carried by the network is independent of the transport protocol used. Because it is expected that links will fade and suffer interference, and that nodes will fail, it is wise to use a protocol that is

robust enough to recover from many such problems. After extensive searches of the literature and considering the base of already installed software and systems, we have chosen the _I_n_t_e_r_n_e_t _T_C_P/_I_P mechanism for the message protocol.[2]

TCP/IP is designed to operate with an unreliable transport system, and its performance improves when the underlying transport system is more reliable. It incorporates packet reassembly and reordering mechanisms that can cope with lost packets, packets received out of order, and duplicated packets. Since the network routing scheme described below will accomodate a failed node by routing around it as

---

[2] A special note here to thank Phil Karn, KA9Q for his suggestion that TCP/IP could run on top of AX.25 - Phil, it was a brilliant idea and solves a problem we'd been discussing for some time.

long as a path exists between the endpoint network nodes of a connection, it was a great advantage to chose the TCP/IP protocol which would correctly utilize such a facility.

TCP/IP also has other advantages which we think places it as the top contender for the internal message protocol. It has been proven by over 10 years of use on the DOD Arpanet/Milnet/Internet; implementations are available for computer systems ranging from VAX mainframes to the IBM PC; it is completely defined and documented; other facilities which use the TCP/IP protocol for file transfer and remote computer use already exist; and much of the software needed to implement TCP/IP is available at no charge.[3]

Therefore, it is planned to implement the network such that all inter-PNC communication is performed using Internet Protocol [IP] datagrams to allow for maximum flexibility in the routing and transport of data, regardless of the kind of link used between nodes. This allows direct interconnection to the Internet or any other IP compatable network should such be desired.

Hank Magnuski, KA6M, has obtained a Class-A internet network number assignment for amateur packet radio.[4] It is anticipated that each PNC will have its own unique block of host numbers assigned. In the case of manufactured PNCs, the PNC host addresses will be assigned when the unit is shipped. For homebrew units, a central registry will assign the number. Since these numbers are 24 bits long, several million numbers are available. The number merely identifies the PNC address and is much like a hardware serial number. It does not have to be changed when a PNC is sold or moved or assigned a new callsign. (For those of you familiar with the internet, an address resolution protocol is used to map the PNC internet address numbers to the PNC callsign dynamically.)

_R_o_u_t_i_n_g _o_n _t_h_e _N_e_t_w_o_r_k

Routing tables are automatically built and maintained by network nodes. When first activated or after a system reset, the PNC has no connections to neighboring stations. Whenever a PNC has no connections it sends a broadcast beacon message periodically (probably every 10 minutes) until

---

[3] Among other sources, Professor Jerome Saltzer of MIT has implemented TCP/IP for the IBM PC. His implementation is available and can be reproduced at no charge, although MIT retains the copyright.

[4] This is registered with the Defense Communication Agency's Network Information Center as network number 044.xxx.xxx.xxx AMPRNET as documented in Internet RFC 870 dated October 1983.

it has established at least one connection to a neighboring PNC. When a neighboring PNC receives such a beacon, it attempts to open a connection to the PNC sending the beacon message. Whenever any node-to-node network activity is detected, routing tables are updated by all PNCs that received the messages so that each will understand the most recent network connectivity. Routing tables may also be exchanged to provide updates.

If a PNC already in the routing table has not been active for a length of time, a message is sent to that PNC to check that it is still active. This is called _p_i_n_g_i_n_g, and will probably be performed after 30 minutes of idle time has elapsed.

If an attempt to communicate with a neighboring PNC fails for any reason, whether during normal packet relaying or as a result of a failed ping, that PNC is deleted from the open connections list and routing table, and will no longer be used for packet relay by the PNC detecting the failure. Thus, the network will recover from and route around any failure that does not isolate a node. When the failed PNC recovers, its beacon or other activities will alert its neighbors that it has returned to service.

Connections between PNCs need not be radio links. Modems, hardwire lines, optical fibres, or other means will serve as well. In these cases, the messages sent by the PNC over these links are identical to those that would have travelled over the AX.25 virtual radio circuit, so there will be no difference in operation with these other types of links.

_A_c_k_n_o_w_l_e_d_g_e_m_e_n_t_s

My deepest thanks to Mike Brock WB6HHV, for his invaluable suggestions on the design of the network, as well as his help in preparing this document.

My thanks also to the many people of the Vancouver Amateur Digital Computer Group and of Tucson Amateur Packet Radio Inc, and to Phil Karn KA9Q, Rod Hart WA3MEZ, Harold Price NK6K, and Skip Hansen WB6YMH for their contributions and suggestions.

Summary:

In England we can send computer data by hooking an accoustic coupler to a rig and transmitting F3E or J3E (ie simple audio). You have to establish the QSO using speech and would need to repeat calls every 15 minutes thereafter. My hope is to work our university Multics system /M (obviously you need a license at each end).

Ian G. Batten, G1FVC.

Summary:

Yeah, and you can use morse on a handheld top-band rig with a trap dipole.

(Top-Band = 160 metre)

              Ian G. Batten, G1FVC.
I'll stick with an FT708!

[]

I'm just guessing but the radios probably use the same technology as
the military which send a sync tone and then convert the audio to
digital, scramble it, and convert it back to audio. When you listen
you should hear a tone followed by static. This is called wide band
secure. This method was attempted by motorola several years back
but the users were not impressed with it, due to the sync problem.

Courtesy of W1GD, here is a version of the RSGB MINIMUF program written
in FORTRAN. It should be compiled with the "f77" compiler.
The results seem to agree with the BASIC version.

                            73,

qst de k9eui
hr propagation forecast bulletin nr 35 from arrl headquarters
newington ct august 27, 1984
to all radio amateurs bt

solar activity has been below predicted levels most of the time since early may. the northern hemisphere summer is never a time of high f layer muf but this summer has brought near minimum dx activity on 21 and 28 mhz.

some improvement will be seen during the ((last)) days of august and things will pick up further during the autumn months. solar flux and sunspot numbers have been below the levels used for the dx chart in qst during the summer. the charts for august 15 to september 15 are based on a flux of 97. the highest thus far in this period was 93 and there were ((garble)) days in the 70s.

the current lull should not be taken to mean that high band dx is doomed for the next 5 years or so. even at present levels

of solar activity the autumn months should bring many good days for users of 21 and 28 mhz. it seems likely that f layer dx on 50 mhz is over for this solar cycle, but other propagation modes will provide 50 mhz dx particularly in ((low)) latitudes and on transequatorial paths.

for the forecast week, higher flux levels are expected, but disturbed conditions are likely august 28 through september 1. generally good propagation is likely september 2 to 4 and after september 6.

american sunspot numbers for august 16 to 22 were between 17 and 9 with a mean of 12.4

[I don't understand this blank line thing, but I'll throw this in anyway]

I'm interested in the packet radio situation on 2meters on the East Coast. In particular, what's possible, what's currently implemented, and how much does it take to get started in this mode.

I've read several articles in QST about people using commonly available packet radio boards to interface terminals to their radios, but these only seem to be for talking to other amateurs directly, (like RTTY but more complex). I'm more interested in computer based applications, such as bulletin boards, networks, repeaters, etc.

Also, what baud rates are commonly used, and what protocols are in the modems used for packet. I have heard about baud rates from 300 to 4800, it would seem at least 2 or 3 protocols would exist...

august 24 1984 to all radio amateurs bt

mellish reef. the down under dxers contest club plans to operate from mellish reef between october 25 and november 6 on all bands 160 through 10 meters. they hope to be assigned the call vk9mr. qsls will go via wk2ku, po box 31, winmalee nsw, 2777, australia.

antigua. wb9ihh and ko1k plan to operate /v2a from august 23 through september 1. operation will be mostly cw, with special attention to the 40 and 15 meter novice bands. qsl to thier home calls.

cambodia. xu1ss is still active on sundays at 1200z on 14245 khz. last week he was heard on the east coast for the first time in several weeks.

cyprus. zc4cz has been quite active on 7007 khz at 2340z.

jordan. jy5ci is active on 14228 khz at 2200z. qsl to box 616 amman.

surinam. pz1dv has been worked around 0100z on 7003 khz.

asia on 40. a group of asiatic russian stations has been

active on 40 meters recently at about 2330z. ug6gdd has been
on 7005 khz, uf6fhm on 7009 khz, um6mkw on 7002 khz and ua0agd
on 7009 khz. ar

It's not spread spectrum. It's Motorola's Digital Voice
Privacy (DVP), with the DES option no doubt.

You can read about it in a DVP Mitrek manual, available for a buck or
so at your local hamfest.

Many HF receivers, such as the Icom R-70 and R-71, have an extra-cost option of an FM detector mode. This is intended, I believe, for use in receiving narrow-band FM used in certain ham bands. I am under the impression that those bands are all above 20 MHz. Does anyone know if these FM options are so contructed so as to only operate in this higher portion of the HF spectrum? Or will they function no matter what frequency the receiver is tuned to?

I ask this because older tube receivers, such as my old Hallicrafters SX-42, which cover from medium wave up to 108 MHz, have FM modes which only function in the higher bandswitch position(s), not at all frequencies. I discovered this when trying to use this receiver toto tune cordless phones using FM in the 1600-1800 kHz range. (I know I can tune in AM using slope detection; I just wanted to use the for-real FM mode if I could.) Since these new-style receivers have no "bandswitch" as such (but maybe a MHz-selection mechanism), it would seem that the FM option could be turned on independent of the tuned frequency. I would appreciate confirmation of this supposition.

Regards, Will Martin

Subject: PPRS September Meeting - Revised Notice

The next meeting of the Pacific Packet Radio Society will be held on:

Tuesday, September 4th, 8:00 pm

AMPEX Cafeteria
401 Broadway
Redwood City, California

On Route 84 at 101 or 280, proceed south on Broadway in Redwood City about 2 to 3 blocks. The cafeteria is glass enclosed and is adjacent to a small fountain area. It will be on your right as you travel south.

Dave Engle, KE6ZE, is sponsoring this meeting, and is lining up hardware for a comprehensive review of Terminal Node Controllers (TNC's).

A terminal node controller has proven to be the easiest and most reliable way to get into packet radio. More and more manufacturers are getting on the packet radio bandwagon, and are coming out with offerings that support the AX.25 protocol. This meeting will acquaint you with the TNC offerings available, and will help you buy a TNC that can walk and chew gum at the same time. Come and learn about the comparative advantages of each model, and listen to the war stories of their owners.

In addition, there will be an opportunity to sign up for PPRS working committees. These committees were described in our August meeting, and in September we hope to sign up members who will help formulate the role that PPRS will play in the future of packet radio.

Plus reports on other topics of interest to our members.

Hope you can make the meeting. 73, Hank

P.S. Mark your calendar for these future meetings of the PPRS:

October 2nd, 1984 - Protocol Introduction, AX.25 - John Gilmore
November 13th, 1984 - Technical Topics - Bob Reiling
December 4th, 1984 - Emergency Communications via packet - Curtis Spangler

****
ARRL Pacific Division Convention - 8/31, 9/1, 9/2 - Marriott - Santa Clara

Packet Radio Session - Paul Rinaldo - 1:00 pm to 2:30 pm
Packet Radio Session - Hank Magnuski - 2:30 pm to 3:30 pm

Fm: NK6K
Re: Software updates.

Since a TAPR software maintanence release will be out soon, I'd like to
make sure we have all bug reports and requests for changes in.

I'll list the ones I know about here, along with a disposition, if known.
Please feel free to make comments on any part of the TNC, hardware or
software. Please keep in mind the following though:

There are now at least 1300 TAPR TNCs (Beta + kit) in the world today.
Many people have written code to match the current user interface,
mailboxes, bulletin boards, host systems, gateways, etc. Ask yourself
if your proposed change will require a change in user software. If your
sugestion would cause recoding of other ham's software, unless it has a major
benefit, we would probably have to turn it down. This is called the
real world, which is something you get into when 1300 hams are involved.

A few of the discussions below will seem long and involved. That is because
some of the bugs are in more advanced features. The majority of the bugs
in the more common features were wrung out in the beta test.

On with the bugs:

1) If RETRY is not 0, the TNC will sometimes disconnect before the
retry count has expired. This problem took a long time to find,

because we couldn't reproduce it. Someone in the field came up with a reliable way to make it happen. The symptom was affected by both the number of frames in flight, and the number of frames in the buffer waiting to be sent.

KD4NL has made a patch, we are testing it in the LA area now and will release it next week. This should make some people very happy.

2) TNC "locks up". This is a difficult symptom to trace. Most of them are caused by a fault in the hardware. We have found a bug in the software that causes this, to my knowledge only one person has fallen in to this particular hole. This is also patched along with the retry bug.

3) TNC prints garbage on the screen, 64k worth, then comes back. I have heard rumors that the GLB board can send a frame which causes this to occur when it is received by a TAPR TNC. If anyone has firm information on this, please send it in. Sometimes the rumor comes in as "The GLB sends an illegal protocol frame", possibly an I or UI frame with no PID byte. Based on that, and the symptom, we have fixed a problem that would occur if that type of frame was received. If you have any info on this, send it in. This will be fixed in the next software update, i.e. it is not patched.

4) The beacon is not started even if a non zero value for beacon time is stored in novram. True enuff. You must give a BEACON command after every reset. This bug will be fixed in the next software update.

5) The 400 and 800 baud rates for HBAUD that were there in 2.1 disappeared in 3.1. A patch is available for this, and has been sent to the AMSAT guys who needed it. They use 400 baud PSK thru Oscar 10. Fixed in next software update.

6) *** connect request comes out in transparent mode. I can't make this happen. It will happen if CONMODE is CONV, you are currently unconnected, and you manually go into transparent mode by saying TRANS. When a connect occurs, you will go into convers mode and will see all messages. If you want to do this, and remain in transparent mode on connect, say CONMODE TRANS. If anyone has another way of making this happen, please let me know.

7) If your terminal overruns the TNC's input buffer by ignoring an <xoff> character, the TNC will never try to <xoff> you again. Serves you right, too! This bug should be fixed in the next software update. See also improvement #11 below.

8) TRACE 2xxx bit doesn't work. Non-header data is always dumped.

9) Autobaud is a bit flakey. Since the hardware has no specific baud rate measuring capability, an easy fix is simply to limit the autobaud choices to 300 and 1200 baud. If this would have caused a great deal of difficulty in getting your board up the first time, please let us know.

This is the end of the known bugs, i.e. those things which work counter to the way we intended, or counter to the way things were documented. Following are change requests.

1) Store a line to be transmitted when your TNC is connected to by another TNC. E.g. CTEXT I'M IN THE SHOWER, PLEASE RING BELL. That message would be sent automatically when a connect occured. This one stands a good chance of getting in.

2) Store a line to be transmitted when your TNC refuses a connect from another TNC. You'd like the other guy to see
*** WB6UUT busy: MAILBOX IS DOWN.

This is a little more iffy. Since the frame used for a connect nak, DM, has no I field, we have to put the text in a UI frame. The connecting TNC would have to have MON ON, and the UI frame would have to follow the same digipeater path back, which may be a different path than UNPROTO packets usually take. Thus, even if you used this facility, you stand a finite chance of it not working. Is this worth the effort to implement? Comments please.

3) Link status check. You'd like the TNC to automatically send a frame to see if the other TNC is still there. If not, your TNC would timeout based on RETRY. The command would be CHECK EVERY/AFTER n, where n is some convenient interval. It would not apply if RETRY was 0. This will require a protocol change or update. Right now, with the poll/final controversy, there is no way to prod the other end into giving a response, short of sending a zero length (PID byte only) Iframe. This seems a bit tacky. This is on the list of things to get resolved at the next protocol review in September.

4) Discard unacknowledged I frames when a disconnect occurs. Currently, if there are outstanding frame, i.e. frames waiting to be acked or resent, or frames that are in the terminal input queue but as yet unsent, we dump them as UI frames to the UNPROTO address list. This is listed under improvements because this is as we intended it to be, i.e. this is a feature, not a bug. We feel this is a useful diagnostic aid. WE in this paper, by the way, is various combinations of KV7D, KD4NL, and NK6K, depending on which of us is responsible for that part of the code. Comments on this one, please.

5) Implement a TNC resident file transfer protocol. When it comes to file transfers, the TNC was designed to be transparent, just like a modem. In fact, if you go into transparent mode, you can run any program that assumes it's talking to a modem and get the desired results. (And no, it doesn't dial the phone on ATDT commands, wise guy). Note that if you want to transfer 8 bit data you must set the AWLEN and PARITY options correctly, otherwise we'll trash the high order bit. Most data transfer programs will run correctly thru the TNC, as long as their internal timers can handle the inherent delays in packet transmission and digipeating. Implementing a TNC based file transfer protocol would please a small number of users,

who would still have to write code on their computer to interface with the TNC's file transfer mechanism. I think the current scheme is the right choice, and is more in line with the division of tasks set out in the ISO seven layered OSI model. Comments?

6) Confirm entry into CONVERS mode. You want a warm fuzzy feeling that the TNC has done your bidding in response to the CONV command. This would require a change that would bother the mailbox/host/gateway crowd. They do a lot of popping in and out of command mode to check status, paths, and other things. An extra message might put the warm fuzzy message into a file, unless they modified their code. Comments?

7) Go back into command mode after a disconnect initiated by the other TNC. Currently, you are left in CONVERS or TRANS mode. This should not both mailbox/host types since ctl-C in command mode is ignored. Comments?

8) Implement a watchdog timer. Have the software pulse a bit on the parallel port at some inner point only reached if the software is running correctly. This is so mountain top digipeaters can reset themselves if something bad happens. Note that this is different than the hardware transmit timer. Good idea, and it will probably be in the next release.

9) Print the digipeat list when

    a) Someone connects to you
    b) When you get a connect request
    c) When monitoring the frequency.

I think a) and b) should be done all the time. c) would add to an already cluttered monitor mode. Anybody see a better way of doing it. Adding another command to enable this would add to an already lengthy command list. MPATH has been suggested.

10) Print connect and disconnect packets in monitor mode. How about

```
NK6K>WB6YMH <C>
WB6YMH>NK6K <D>
```

There are connect ack and disconnect ack frames, but that might be getting carried away.

11) Increase the number of bytes that the TNC will handle from the terminal after the TNC signals <xoff>. Currently, you must stop within five bytes. After that, the TNC sends another <xoff> after each of the following five bytes. After that, any characters received before the TNC sends an <xon> are discarded. While this has not been a problem for users writing file dumpers in assembler or some high level languages, it has been a problem for programs which dump a line, then look in their input buffer for <xoff>. We will probably increase the guard space to at least 80 characters. Anyone need more?

12) Output <CR> after the callsigns on monitor lines. This would
give more room for digipeat paths and not break up data lines
as much.

13) Echoing xoff and xon. Currently, if the terminal sends a flow
control character out of sequence (xon before xoff, 2 xoffs in
a row, etc.), the TNC treats such characters as data and echos
them. This has the interesting effect of locking some terminals.
It has been suggested that we eliminate this feature and ignore
those characters.

That's the list as I know it to be. Submit any others to the TAPR PO
box.   Now that we've got a secretary, she's in charge of not loosing them.

Remember, the TRACE command is handy for looking at the protocol and seeing
exactly what the TNC sent/received, including user data. Please include
hardcopy of traces for protocol error reports.

NK6K for KV7D and KD4NL, TAPR Software Group.

qst de k9eui
hr propagation forecast bulletin nr 29 from arrl headquarters
newington ct july 16, 1984
to all radio amateurs bt

the solar flux resumed its usual downward trend during the past week, moving from 101 on july 9 to 89 on the 15th. this range is slightly below the base value used for the propagation charts in qst for july 9, but not enough to make a significant difference in midsummer dx conditions.

the state of the earths magnetic field is more important than the solar flux in determining the usefulness of our dx frequencies in midsummer. high geomagnetic activity narrows the useful rf spectrum and causes erratic fading and increased distortion on voice signals, especially on high latitude circuits. these adverse effects were very marked july 13 to 15. they will be in evidence often through july, though less than in the days just prior to the issuance of this bulletin.

with the sun moving southward again, dx conditions will improve gradually over the next six weeks. the change will become most obvious in early september.

american sunspot numbers for july 5 through 11 were between 52 and 82 with a mean of 65.7 ar

I totally disagree with the "Ham radio is a hobby second and a service first" ethic. It is a hobby first! It is in someway paid for with public service; but that is not its primary function.

I thought that it was not a good idea to use one's social security number for marjing valuables since it was so difficult for anyone to get the information on who the number belonged to. I was always told the best number to use was your driver's license. I would think second best would be your ham call.

Richard Loken hit one of my 'hot' (no pun intended) buttons in his
posting on CW.

"We will all die in the year long winter anyway."

I've spent some time researching the effects of nuclear war, both for
my own interest and professionally (I designed radiation hard VLSI
computer chips at TI). After surveying all the TECHNICAL literature that
I could find, I have come the conclusion that even all-out nuclear is
SURVIVABLE. That doesn't mean its morally right and I reserve the right
to dispute any other 'conclusions' drawn from this FACT. But civil
defense measures in this direction are not a waste of effort (if done
correctly).

This nuclear winter business is interesting and deserves more study.
My SPECULATION is that it, too, is survivable. My rational for this
opinion is that the human race has already survived a similar phenomena:
The year without a summer - 1816. This was caused by the eruption of
a volcano, Tambora (sp?). Folks survived then (obviously), and with todays
technology and knowledge , I should think we could do as well or better.

Now about CW. My only objection is requiring escalating CW proficiency
for VOICE privileges. Everyone should learn 5 (maybe even 10) wpm, but its
hard to explain why you have to learn more CW to get away from it! The
rewards of greater band privleges should depend on a demonstration of skills
required for those bands and modes!!

We had a voice id on our repeater about 10 years ago (along with the cw id) and I agree with what someone else said on the net, it does not work too well. The level is too high and it wipes out a user. One good thing can be said for it however, and that is that it can be faster than a 20wpm cw id. The thing is to make it go off between transmissions.

We found that a high frequency tone is best for a cw id. Something between 2000 and 2500 Hz. It need not be as loud as a lower tone and it is better heard on the small speakers in hand-held units.

Has anyone used a subcarrier on a repeater for telemetering purposes? Since the sudio is normally cut off above 3000 Hz, it would seem that one could insert a low level 4 khz subcarrier and fsk it with data.

TO ALL VANCOUVER BOARD USERS

JULY 2, 1984

Recently, The Amateur Radio Research and Development Corporation (AMRAD), originators of the now popular AX.25 packet radio protocol, developed a retrofit board for the Vancouver

Terminal Node Controller board, originally developed by Douglas Lockhart, VE7APU. Using the daughter board (part number VDS-1), systems designers are now freed from the memory constraints of the original board. This translates into better operation for the packet radio enthusiast.

Some of the advantages of the AMRAD Vancouver Daughter board system are:

* No modifications (jumpers or traces cut) required on the Vancouver board for normal operation

* No jumper wires to hook between the two boards. All connections necessary are done via wire-wrap sockets.

* From 8k (using 2716's) to 32k (using 2764's) of EPROM

* From 8k (using 6116's) to 32k (using Intel xxxx's) of RAM

* Software programmable baud rate generator (using Intel 8253)

* Optional use of timed interrupts for better software control

* Position for up to six 16-pin sockets for user kludging

* Position for one 24-pin socket for user kludging

* General kludge area of 1.1 by 1.7 tenth-inch spaced holes

* Uses only two additional IC's (other than RAM and EPROM)

* requires no additional power supplies (in fact the minus five volt supply needed for the 2708's can be eliminated)

* Full documentation available.

* Priced inexpensively at only $25.00 for the bare board.

To order a VDS-1 board, send $25.00 plus $2.25 for shipping (US funds) to:

<gulp>
I found Andy (N6JLJ)'s article quite interesting. I would agree that the
single most important thing for the FCC to require of potential Hams is
TECHNICAL COMPETENCE, and I like some of the articles suggesting that a
practical theory exam is the way to do this. Can this be tied in with the
FCC proposal that volunteer examiners design their own exams? (cf. ARRL
bulletin #54).
I'm all for packet radio and other state of the art means of communication
(perhaps also moving to higher EHF/SHF frequencies - I believe that the FCC
has allocated substantial blocks of 20+ GHz for amateur use, and you only
need a Tech license (5 wpm code) to go up there), but I'm concerned about the
viability of a packet or other high tech station in an emergency. Give me
something simple when the things get rough (like massive power outages - perhaps
I'm biased since I'm from NYC and its happened here twice already) that I
can get through to as many stations as possible with compatible equipment
2m HT's are good IF the repeater has emergency power, otherwise I'd think
a CW rig is the way to go.

Re the NCIC being keyed by SSN:
I doubt it (although I may be wrong), since the Social Security Administration
is fairly adamant about not disclosing SSN's.
All the police Operation ID flyer's I've seen around here (Northern NJ and NYC)
and in the Boston area when I was a grad student at MIT explicitly say NOT to
use your SSN for this purpose, since the police cannot get the number.
They recommend use of driver's license numbers instead, and I think driver's
licenses are the key to the NCIC data base.
My original article was directed to those of us who can't or don't drive, and
I suggested several alternatives that could be obtained relatively easily, like
ham radio calls and equipment serial numbers (which can be given to the local
police for entry into NCIC).

    NO! Do not put your social security number on any
property that you wish to have recovered by the police! I
worked for the police department when I was in school, and
they had an entire room full of stuff that they couldn't
get back to their original owners because it was incorrectly
marked with social security numbers instead of drivers license
numbers. DLs are easily looked up over computer terminals
that are present in most police departments. SSNs are just
about IMPOSSIBLE to look up. The stuff that was recovered
with SSNs on it was eventually sold at auction.

Morse code should be treated exactly the same way as Latin
(both are languages in a general sense):
everybody should know them, and *nobody* should
(routinely) use them.

Dear network,

I wonder if anyone out there has any information on the AX-25 'standard'
for packet radio. Work on that is just in its early stages over here, and
I had heard that this packet format was in use in the USA.

Being unable to talk to the states on the radio (I'm only a "B" license here,
which means above 144MHz only), I thought that I might use other means to
get in touch with anyone who might be able to tell me something about it.

Any and all information or references would be gratefully received.

P.S. -- Why is there hardly any traffic on net.ham-radio ?

For me (on the East coast) I've always gotten CHU on 7.335 very well during
the day. In the evenings, some high speed RTTY service comes up just
below frequency, but using USB (CHU suppresses its lower sideband anyway)
seems to fix that problem.

Phil

The interference may be due to radiation from neighborhood television
receivers or VCRs. Try a CHU listening test at 4 am.

Regarding emergency communications -- Let's not forget that there
was a time before repeaters.

I would like to encourage more hams to monitor the 2m simplex
frequency 146.52 when possible. There are areas where repeater
coverage is poor, or during genuine emergencies (floods, earthquakes),
most repeaters are not operating.

I have had one emergency experience where 52 simplex saved the day.
And this was from the bottom of the Grand Canyon! Not an optimal
site for simplex coverage! By good fortune a commercial airline
pilot (also a ham) was calling another station. I had given up
on repeaters of course, and settled down to monitor 52.
After about 30 minutes, there was a call, and I promptly broke
in with an emergency request.

He was at 30,000+ ft, and 80 miles north. I had an IC-2AT with a
Vocom 5/8ths whip.

Certainly this is not an adequate solution to all emergencies,
but with more people listening, the better it is.

I would suspect that for ham equipment, call letters are adequate,
but not for other kinds of stuff.

Why do so many hams consider simplex patches to be illegal? Why, I even
saw a spot in QST which indicated they were considering not printing any more
ads for the devices because of their questionability. Since Dallas ham
radio stores have been barred from selling the patches, if QST quits
advertising them, I would most likely have to fly to the middle of Kansas or
somewhere to buy one!

What is the difference between a simplex patch and a repeater patch,
besides the duplexity? The nature of the conversation dictates the patch's
legality. The argument that simplex patches would compete against Bell's

mobile phone service is absurd, since hams don't get licenses merely to get them revoked for calling businesses on patches, and businessmen don't purchase mobile phones merely for pleasure. Will someone please enlighten me to the reason why these patches are considered illegal.

A new set of Keplerian elements has been posted to net.ham-radio.

In response to a request by DJ4ZC at the England technical meeting,
I have added a new entry to each set, the "Ref perigee" time.
This is the time of the perigee nearest to the reference epoch of
the element set. It is expressed in the "AMSAT-DL standard" time format,
i.e., decimal days since 00:00:00 UTC 1 Jan 1978. For added convenience,
a human-readable time format follows on the next line. The perigee chosen
may be either before or after the reference epoch, depending on which is
closer.

This is a derived element in that it is not part of the NASA/NORAD sets, but
is calculated from the epoch time, mean motion and mean anomaly at epoch.
Apparently there are many users of a Sharp hand calculator tracking program
which requires perigee times and these calculators cannot be easily
reprogrammed. Users of the many W3IWI program variants do not require this
information and may safely ignore this new entry.

Those using the Ref perigee time should note that the other orbital
elements remain valid at the Epoch time, NOT at the Ref perigee time.
For most applications the rates of change of the elements over this
time difference (e.g., the secular perturbations in RAAN and Argument
of perigee) are small enough to preclude any significant error.

73, Phil

[]

I am posting this for a friend. Can any of the readers of ham-radio advise him on simplex auto patches?

He is looking for general info such as good brands/models and also the ones to stay away from. Features to look for etc.

Thanks in advance

This has been around some time ago, but can someone give me recommendations for a quality communications receiver? I have had the ICOM R-71 recommended, and have had people tell me that the Kenwood 1000 and 2000 aren't worth the money.

thanks in advance
Steve Crandall

WD6BBQ suggests that people monitor 146.52 when not otherwise using
their 2m xcvrs. I think this is a good idea. A problem exists,
however. Since so many people use 52 as their first choice of simplex
freq, the channel is often occupied; very few people are willing to
monitor for possible emergency calls if there is constant chatter on
a channel.

Other services have solved this problem by designating an emergency-only
freq (e.g., aviation band) or a calling-only freq (e.g., marine band).
(A calling-only channel is used for emergency calls, but also for general
calls; once communication is established, you move to a different freq to
free up the calling channel.)

I'd like to see 52 used as a calling freq. Now that the great majority
of hams are using synthesized equipment on 2m, there's no reason why
people can't move off 52 once contact has been established.
There are fairly-well-respected calling freqs in the ssb segments
of the v/uhf bands (e.g. 144.200) - why not for FM? Think how
much easier it would be to make random simplex QSO's, try to work
FM DX, etc. if everyone interested in making a QSO listened on a
single channel; it would work if people would agree not to ragchew
on that channel. And think of the implications for getting help
in an emergency, as WB6BBQ suggested, if there were one channel
that everyone listened to, but nobody ragchewed on.

Comments invited.

According to my records:

-The US Navy is allocated 7.336 MHz for 10,000 watt coastal stations
using emissions of 0.1A1, 1.24F1, 3A7J, and 2.8A3J along the Atlantic
Seaboard, especially in Virginia.

-The US Air Force is allocated 7333.5 MHz for fixed and mobile use
USA-wide, but only for 3A3J emission at the 500 watt level.

This topic was brought up just this afternoon at the ARRL National
Convention in New York. Ray Kowalski's (of the FCC) first answer was
"don't ask". He then went into a very strong series of comments that
if we're not careful, "simplex autopatches will end amateur radio
as we know it". Read into this what you will. I think there are
several issues involved:

1. Technical legality under existing rules (need for separate control
link via wire or 220 mhz radio or above, control operator monitoring)

2. The potential for abuse (business calls, etc).

In my (KA9Q) opinion, there really isn't any difference between simplex
and duplex autopatches, but the latter have raised a number of grey-area

issues over the past ten years, and simplex autopatches are likely
to force the issues because "everybody will have one".

There were several other items of note from the National ARRL Convention
FCC forum:

1. The ARRL's request for HF phone band expansion has just been adopted.
2. The ARRL formally signed an agreement with the FCC to become a
Volunteer Exam Coordinator (VEC).
3. Bob Foosaner (Private Radio Bureau chief) commented that the pressure
for spectrum from Land Mobile users is extremely high. He went on to
say that while the no code license proposal was being considered, there
was some thought being given to accomodating them on 220 mhz. However,
he said, the amateurs have made it abundantly clear that there is no
room ANYWHERE in amateur radio for a no-code license. Therefore, it will
be much harder to defend the relatively lightly used lower part of 220
mhz against being reallocated to Land Mobile. He did go on to emphasize
that this is only one of the many options they are considering, which
also include reallocating some broadcast spectrum. However, the demands
are extremely high; they estimate over 100 mhz would be needed to
satisfy demand even INCLUDING the conversion from FM to compandored
SSB!

I (KA9Q) think there's a moral in here somewhere.

In regard to the no-code discussion, which I feel somewhat responsible
for restimulating, I would like to indulge in patting you guys on the back
a wee bit:

In other news groups on this net, any discussion with this kind of emotional
loading would have propagated to net.flame, net.general, and net.followup
by now. I have also seen only one "personal attack" in the whole of the
discussion. The quality of knowing how to communicate without abusing the
medium seems to be the prime requisite for being a ham. All else is really
just an attempt to express that in rules and requirements. And we never
explicitly test for courtesy!

I see we're still about evenly split on this network; I think it is because
the combination of ham radio and computers selects some good minds
(and naturally I feel this is demonstrated by coming out on my side of
the argument :-)).

The outcome for Morse code requirements will probably be the "test of time".

I was listening to Hal Abelson a few nights ago in an after dinner talk;
he mentioned seeing some quotes on an office door about education--he
realted these to computers and education. The quotes were the collected
ramblings of educators of the past discussing what was really NEEDED in
the school curriculum.

The progression included: "I think it is criminal to give these students
slates--what will they do when they find they have to write in the middle
of the woods and do not know how to prepare tree-bark?", "We cannot
allow students to use pencils, as they will then lose the necessary
skill for filling their pens with ink" and similar sayings. Like educators,
I think we lose sight of just how technology driven our license requirements
are.

Morse is no more nor less important than the papyrus reed, the cuneiform
tablet, or parchment. We do not require writers to study these because
we can get by easier without them. We don't require engineering students

to use a slide rule because calculators are faster and economically
cheaper. We still have people who can and do use all of these.

Radio has been with us for such a short time that we haven't really had
time to see many technical revolutions.

This disagreement by people, even loudly and irrationally, is the process
by which we decide WHEN the time has come for a change. I guess it isn't
time yet. I still cannot picture ham radio in the year 2025 as being
involved with Morse code--more likely Huffman codes!)

I guess we`ve done okay so far, and I'm willing to talk while I wait
for the twelve year cycle. Meantime it's on to the satellite computer
net. Whatever technology we use, let's just make sure to keep the
spirit alive!

WA2YBA

[] <-- Eat Me

John, I must say that the government has got you indoctrinated very
well! Not only are you being pulled by the ring in your nose, you
even read the back of government paperwork. I've written several
government documents and I must tell you that what the people want
is what the people get. If Hams [Those that favor no-code] want the
code requirement lifted on VHF and up and can get a majority, guess
what? They get their way. And if Pigs[Those that favor code] want
to stay on 1GHZ and tap code across the block (They never heard of
cans and string) and have the majority then guess what? They will
get their way! So john if you still are sending morse code on VHF
and up and reading whats on the back of government paperwork (try
reading a book sometime, its much more educational) then I believe
that you need to take an inventory.

<gulp>
I like the idea. It seems like a good way to provide emergency communications
when the machines are down. The best idea would be to use 52 as a calling
frequency and then get off it -> another simplex frequency once a QSO is set up.

It does not matter if the patch is simplex or whatever. The legality
of its use lies in the fact that the system must have a separate
control frequency, just like a repeater. The control link must be
220 MHz or above, or a landline that is not used for the patching
itself. Since simplex patches are more likely to be used by individuals,
where duplex patches are usually on a already properly controlled
repeater, it is more likely that the simplex patch will not be used
legally.

For those of us who are bewildered...

Would someone post an explanation of what a "simplex autopatch" is and
why it is different from the autopatch tie-ins to telco lines commonly
found on repeaters (is this latter what you mean by "duplex autopatch")?

I thought that "simplex" meant "using only one frequency", and that
"duplex" meant "using two frequencies -- one for transmitting and
one for receiving". I fail to see how this distinction could make
the basis for a "religious war" about the propriety of autopatching.
What difference does the technical detail of the implementation method
make? If autopatching is good, use whatever it takes to do it. If it
is bad, it doesn't matter how it is done, does it?

Confused,

Will

qst de k9eui
hr arrl bulletin nr 60 from arrl headquarters
newington ct july 21, 1984
to all radio amateurs bt

the american radio relay league is now a volunteer examiner coordinator. on july 12 the commission ruled on docket 84 265 permitting recoupment of expenses by vecs. in anticipation of this, arrl had filed its petition to become a vec on june 27. on july 21, culminating more than two years of intensive planning and preparation, representatives of the arrl and the fcc signed a memorandum of agreement at the arrl national convention in new york city.

the agreement authorizes the arrl to accredit volunteer examiners and coordinate giving upgrade exams in each of the 13 fcc defined regions. the arrl will now proceed on its announced course of action, coordinating technicnan, general, advanced and extra class exams at hamfests and conventions in september and october. beginning in november of this year, arrl will coordinate exams at any location. sponsors must register their intent with the arrl vec office, 225 main street, newington, ct, 06111, at least 75 days in advance.

the thousands of advanced and extra class licnsees who have applied to serve as volunteer examiners with the arrl should complete and return their application materials to hq as soon as possible. they will be accredited and sent credentials in time for the first arrl coordinated exam sessions in september.

to determine when exams will next be given in your local area, check hamfest and convention brochures for september and october. your fcc field office has exam schedule information for all vecs. an article on taking exams under the volunteer examiner program will appearin an upcoming issue of qst. ar

hr arrl bulletin nr 59a from arrl headquarters
newington ct july 20, 1984
to all radio amateurs bt

the fcc released a memorandum opinion and order on july 20
clarifying some volunteer examiner details, pr docket 83 27.

the fcc says that (it) is inadvisable to attempt to specify
items as a reimbursable cost. if the expense relates to
amateur examinations, then it is a reimbursable cost.

in short, fcc expects vecs and ves to use good business
judgement, reminds the examiners that all expenses must be
necessary and prudent. details will be in an upcoming issue of
qst ar

qst de k9eui
hr arrl bulletin nr 58 from arrl headquarters
newington ct july 20, 1984
to all radio amateurs bt

the fcc released on july 20 a second report and order on the hf phone band expansion docket, pr docket number 82 23, and also granted the petition, rm 4228, filed by randall f. soball, kh6xx, allowing phone operation on 7075 to 7100 khz in the state of hawaii.

effective 0001 utc, september 1, 1984, these will be the new hf radiotelephone subbands.

3750 to 3775 khz extra class
3775 to 3850 khz advanced and extra class
3850 to 4000 khz general, advanced and extra class

21200 to 21225 khz extra class
21225 to 21300 khz advanced and extra class
21300 to 21450 khz general, advanced and extra class

28300 to 29700 khz general, advanced and extra class

with regard to the 40 meter band, fcc concurs with arrl that phone band expansion here would be detrimental to cw operations. however, the commission will allow phone operation on 7075 to 7100 khz in hawaii and other areas near region 3, and alaska.

remember that these new phone privileges are not available until 0001 utc, september 1, 1984.

in summary, the commission adopted the plan as submitted in the arrls comments with the addiion of expanded phone operation at 7075 to 7100 khz in certain geographic areas near region 3. details will be in the next issue of the arrl letter and september qst ar

qst de k9eui
hr propagation forecast bulletin nr 30 from arrl headquarters newington ct july 13, 1984
to all radio amateurs bt

the solar flux fell to a seven year low of 74 on july 20. the most recent 74 had come july 19, 1977, when cycle 21 was only one year old. the occasional reappearance of such low solar flux numbers should not be taken to mean the end of f layer dx on our bands above 14 mhz for the next four years, however. the flux was back up to 84 on the 21st, and considerably higher values can be expected occasionally through at least 1985, and possibly longer.

the very poor conditions during july were mostly the result of severe geomagnetic disturbances. the earths magnetic field is expected to be less active through the rest of july, and into early august, so there should be a general improvement in signal strength and quality on all dx frequencies. watch wwv for k indices of 2 or lower indicating improved propagation in the higher latitudes of the northern hemisphere. the k index was 3 or higher almost continuously july 11 through 21.

this summer has been a disappointment for users of 28, 50 and 144 mhz. scattered e layer openings will continue through early august, but less frequently and over smaller areas than is normal for the summer season.

american sunspot numbers for july 12 through 18 were between 13 and 48 with a mean of 29.0 ar

K1DK writes--

  >I'd like to see 52 used as a calling freq. Now that the great majority
  >of hams are using synthesized equipment on 2m, there's no reason why
  >people can't move off 52 once contact has been established.

Isn't .52 supposed to be the "National Calling Frequency" anyway?
I always thought that it was supposed to be the way K1DK describes.
'Seems to me that I read that in the ARRL repeater directory or some
such place. In this area, .52 is regularly used for extended QSOs.
For that reason, I avoid it.

A simplex autopatch (called a 'simplex phone machine' out here in
California) is a telephone intertie that works in the following manner:

A receiver listens to a simplex channel (preferably a lesser used one,
but some people aren't that courteous), and waits for a specific tone
sequence to appear - usually a combination of a touchtone sequence and a
subaudible (PL) tone.

When that is detected, the control equipment takes the phone line
off-hook, and transmits on the same frequency as the receiver was
listening. Every so often (typically, once a second) the transmitter is
dropped to allow the receiver to sample the channel. If a carrier is
detected during this receiver sampling slot, the transmitter is
inhibited and the receiver feeds the phone line. As soon as the
receiver detects the carrier has dropped, the transmitter is enabled
again and the sampling begins.

Because of the simplex operation, it is a trivial matter to adapt your
home transceiver to operate in this manner, and because of the tone
access, the device is assumed to operate under the 'automatic control'
provisions of the Rules.

Except for the annoying bursts of noise (the 'squelch tails') caused by
the transmitter cycling during receiver polling, they seem to work
pretty well. All you have to do is remember to wait about a second
after you key your transmitter to talk, to allow the receiver sampler
time to notice that you are transmitting.

I'm interested in opinions on some of the newer hf tranceivers on
the market - in particular, the Kenwood and Yaesu rigs
that cost around $800.

The Canadian packet licence is an extremely difficult exam I am told. It
appears to me (somebody has disagreed at least once before) that the licence
is aimed at Electrical Engineers and other highly skilled people who are
looking for a corner to experiment in.

The main effect of the morse code is to keep most of the new blood out of Amateur Radio. This is most evident when I demonstrate packet radio to my non-ham friends. Most of them have the technical expertise to be a credit to our hobby, but will NEVER be a part of it, as long as they have to spend a lot of time that they do not have on this antique requirement.

The fact that it is possible for a 12-year-old to learn morse code is irrelevant. That's when most of us learned it. IT IS FAR EASIER FOR A TWELVE-YEAR-OLD TO LEARN MORSE CODE THAN FOR AN ADULT TO DO SO. The result is that most people who did not learn it when they were growing up are locked out of ham radio.

The Japanese have a code-free license, and this has greatly increased the interest in Amateur Radio there. To the extent that we shut off such interest here with the code requirement, we put our entire electronics industry at a disadvantage.

Sir--

ONE point to keep in mind, having a ham ticket and using as large a spectrum
of frequencies available to hams is a PRIVILEGE, NOT a RIGHT such as freedom
of speech!
Privileges ARE normally earned. Rights are normally given.
Privileges are not normally abused. Rights generally are.

73's,
     --Tim KE5EP

See my earlier message on the REAL reason they want us to learn Morse, and

quite properly so, to make us a more valuable emergency communications resource. Sorry if you don't feel like being a resource, but read the back of your license.

I agree that youngsters probably have the easiest time of it, but there are numerous cases of people of all ages learning the code. The MOTHER of one of our local hams learned the code and got her ticket (Advanced, I believe, by now) at the age of 74. This is by no means an isolated instance, either. Many people take up ham radio after retiring at 65.

Regarding Japan's experience, they are currently experiencing massive band crowding and a surprising lack of radio discipline, considering the cultural traditions of Japan. I don't think Japan is a good recommendation for a code-free license class.

Now that the argument is over as far as the FCC is concerned for (I am told) at least twelve years, we should all pitch in and try to help and encourage aspiring hams to get past the very minor obstacle that the code represents. If anybody out there needs help or encouragement or tapes or on-the-air practice, let me know and I for one will be glad to try to help you.

*** I GOT A SERVICE MSG THAT THIS DIDNT MAKE IT TO SIMTEL20. PLEASE
    DISREGARD IF A DUPLICATION; ELSE DELETE THESE 2 LINES ***

Ref. - recent ARRL bulletin # 50 (below):

    qst de k9eui
    hr bulletin nr 50   from arrl headquarters   newington ct
    june 22 1984   to all radio amateurs bt

> the efforts of radio amateurs in meeting the challenge of emergency communications readiness through participation in the 1984 american radio relay league field day and in the exercises sponsored by the national communications system are greatly appreciated. your communications skills are a vital resource to our country.
>
> signed, casper w. weinberger, secretary of defense. ar

The amateur radio service is NOT handed all that spectrum just for our amusement. The PRIMARY justification, in the face of a LOT of competition, for all those Megahertzes we call home is that we are a major emergency communications resource. Both us as operators and our equipment.

Read the back of your license, last sentence, for further clarification.

Morse code, with the most sophisticated signal processor known to Man (the human brain) as receiver, is well known to be able to "get through" under many kinds of highly adverse conditions in which most other modes fail miserably.

Morse transmitters can be "jury rigged" in the field out of junk parts in an emergency. Like a battery and a roll of wire. (Try to build a computerized ASCII terminal starting with those resources!)

I know of one recent case (circa 1980) in which two people were rescued from virtually certain death after an auto accident because one of them happened to be a ham and happened to be able to send Morse code using the touch-tone pad on his 2 Meter FM rig. I never learned just why he couldn't use voice; probably either his injury or that of the microphone prevented it. But if he had NOT known Morse, two people would now be dead unnecessarily. (Details available on request -- it was a pretty dramatic incident.)

Morse IS a bit of effort to learn, and can't effectively be taught quickly in an emergency situation.

For all these reasons, it is in the public interest that ALL of us be coerced, wheedled, conned, tricked, and/or otherwise forced into learning the code whether we are interested in doing so or not. The only exception I would support is for people who REALLY are medically impaired in a way that makes this impossible or an undue burden. And I think when one looks into this, that's a VERY small fraction of those who seek relief from the code requirement.

It is also in our PERSONAL interest, because knowing the code could (as in the case mentioned above) save you own personal life someday.

Besides, Morse code is actually FUN, like skiing or ice skating, once you stop grumbling and get some proficiency in it. And the way to do that is to USE it, just for fun, once in awhile, even if your main interest in ham radio lies

somewhere else. Get into a CW "ragchew" from time to time. This takes away the drudgery of practice and makes it actually interesting. HINT: As with tennis or chess, you progress the fastest when you work with an "opponent" more skilled than yourself.

  I thought this topic was well chewed over during the days when
the FCC was considering a no-code license. Anyway, I'll drop in
some observations.

  Just because a hand-held doesn't have a Key jack doesn't mean
that the Morse Code isn't used on VHF. I have an HF transmitter
that doesn't have a SSB mode. By using that sort of logic, should
one assume that SSB is not used on 40 meters? The point is: Morse
Code *is* used on VHF! Just because you only have an FM rig and
don't listen to the DX'ers and satellite buffs doesn't mean that
a particular mode is not in use.

  Do some reading in some of those sections of Worldradio or QST
that you usually skip over. You'll find lots of instances where
knowledge of the Code saved life or property. Without our large
pool of world-wide "Code Readers", many of those instances would
not have turned out so well.

  And a final note...not all the world is affluent! Remember the
project the ARRL advocated some years back of encouraging clubs and
individuals to sponsor a $50.00 rcvr/xmtr kit to be sent to various
third-world locales? If the U.S. went no-code we would be
effectively saying to the less-affluent hams of the world "We don't
want to talk to you unless you can do SSB or ASCII!"

Ham Radio has many facets. Your license allows you to enjoy any
and all. Getting it means you are *qualified* to use any mode.
Just because you aren't interested in a particular mode today
doesn't mean you won't be next month.

From the laid-back (lassiez-faire) ham shack of W4IZI.

Mgweed (pronounced mig-weed) stood for Montgomery Western Electric
Engineering Development. (Named before we became AT&T Consumer
Products!) All six UN*X machines on our site have similar names
all beginning with 'Mg' and four more letters. Orders from corporate
headquarters dictate this naming scheme..

Thanks for support on the bulletins...

From: William G. Martin <WMartin@SIMTEL20.ARPA>

Gentlefolk:

I finally did what I promised I would do and looked up the Monitoring Times discussion of the source of the new-style wide-coverage Regency scanners. Refer to the March, '84, issue. The Regency MX-5000 is really the Japanese AOR Corp AR-2001 scanner with a Regency nameplate. This AOR scanner had been marketed in Europe since Fall '83. In the April, '84, issue, there is a report on this model which states that the plastic cabinet allows excessive synthesizer noise to feedback and swamp the scan/search function when the attached indoor whip antenna is used. Works much better with an outdoor antenna. Some rather poor user-interface design comments, too -- you have to ride the squelch control to stop it on-frequency in search mode, and restarting searches start over again from the start point, not where it last stopped. Yech...

Regarding the discussion of the worth of the bulletins and the value of Morse -- over on the ARPA/MILNET side, here on Info-Hams, the START of those discussions never appeared, as far as I can recall. We suddenly started seeing follow-ups, but never the base or original postings which started all this flamage. Somebody want to find and re-post those items so the other half of the world can see what we should be flaming at or about? (Add a subject line indicating that this is the original re-posted, please.)

For what it's worth, I like the bulletins and I'm not even a ham. I can ignore what doesn't interest me. (I am not qualified to comment on the code business; even if there was no code requirement, I doubt that I would have gotten a ham ticket. I am more interested in reception than transmission. The only thing ever tempting me to become a ham was the whole idea of having a 2m handheld with touchtone pad, which I could use over a local repeater for a much-less-expensive mobile telephone service. The reports of malicious interference and the need to be careful about "non-business" usage put me off that idea. I understand that most repeaters allowing telephone patch-thru require users to join a support group and pay a fee, which seems reasonable. How much is this, normally? Is the service usable and available enough to make this worthwhile for an ordinary person [as opposed to one who lives on the phone -- you know the kind]?)

Will

I was not a net reader when you (plural) were chewing over the codeless
license. I have read parts of the rehash and would like to know how
people with my particular view were answered by the majority.

I know several people, most of whom are EEs, especially in microwave
engineering, who would apply for a code-less VHF-UHF license and bring
some of their expertise into amateur radio. They cite the stumbling block
of the code as the reason they will not apply.

Now personally I agree that once in the ham fraternity such folks would
find incentives to learn the code. I didn't really like it myself for
quite awhile, and then some friends at W2SZ took me on a moonbounce expedition.
There is nothing like trying a VHF/UHF contest for proving your new 1.2 GHz
amplifier either--not a whole lot of phone in that last I checked.

I don't think whether code is useful or not is at issue--I think it is,
and if I'm wrong we will all just plain stop using it and it will go
away. The open question is whether to get people who will not learn
the code a novice type ham license so that we can benefit from the new
blood.

Not all of us took up this hobby to be operators. Some are mainly
equipment builders, or interested in public service, or even chess.
I feel that it takes all kinds, and that we want the kind that will
contribute, even without the code. We seem to have enough appliance
operators to go around. I believe that making the codeless license
require a tough technical test and limiting privileges will make sure we get
good technicians, and not CBers.

Aside from the "No one gets into this club unless he passes the same initiation
I had to pass" arguments, what were the objections to the codeless
experimenter license? Please feel free to use direct mail for
responses, and flame at me if you wish. I'd really like to know what
drives League policy here, as the FCC seemed ready to go for this idea
before ARRL started lobbying--does anyone think that impression wrong?

I really don't see what the problem is with learning morse code. The argument
was that it is not used much on vhf and uhf frequencies. Well if you are
only interested in these frequencies then a technician license will give
you all the privileges that you need. You are not telling me that 5 wpm
is too much to cope with are you?

I took my own advice and found the originals of the "no code" and "anti-bulletin" messages over on USENET's net.ham-radio. Here they are, for the Info-Hams people who never saw them. Maybe they'll show up eventually, but I'd like to point out that BOTH have the ":-)" symbol on them. Obviously mpackard is pulling the legs of those who reacted so strongly. (I've edited out some header garbage but left the text untouched.)

Here they are:

:-)

I would like to start an argument on net.ham-radio as it seems there is no food for thought on this note.
  The subject is no-code on 50 Mhz and up. I believe the requirement for an amatuer to learn morse code for these frequencys is pure hogwash. The number of radios available on these frequencys is more than enough to eliminate the need. When was the last time you saw a jack on a two-meter handheld that said 'key' on it? The poor users couldn't do morse if they wanted too. The above statement refers to the fact that in this day and age the only concievable purpose of morse would be for emergencys when your microphone broke and for practice to maintain currency. Wayne Green says if hams want morse than by god they better be current and able to operate with it. A person should retest every year and even be required to show a speed improvement also. I believe this would be fair. My interest is in microwaves and I just don't see where the ham community would benifit from my knowing morse code. Hell you guys don't use morse actively up on these frequencys anyway.
   Don't send me any mail on this subject but go ahead and start arguing (sp?).

:-)

Does anybody read the garbage from mgweed!rjr about bulletins?
I don't listen to the stuff on the radio, much less read it!
Am I missing the importance of that garbage?

Interesting comments Andy, and I agree. Here are some other thoughts.

- There is a no-code band. It's around 11 Meters.

- Code is good for those who want to use it, and I do.

- Very few Amateurs use their equipment for emergencies.

- Not all the jammers are in California. - They are in Dallas too - and they are usually locals.

- Some are the good ole boys who don't want the lids, kids and space cadets using "their" frequencies.

- It appears that the original message was inteded to start a controversy. WOW!

- Amateur radio provides a foundation for many and varied interests.

- That's what we aught to be concentrating on!

qst de k9eui
hr propagation bulletin nr 27 from arrl headquarters newington ct july 2 1984 to all radio amateurs bt

the solar flux average for june was 100.4, the lowest this year, though there were two months below 100 in 1983. perhaps more significant is that there was only a 19 point spread during june. these facts emphasize the difference in the character of the sun in the low years of the solar cycle.

there will be less day to day variation in the solar numbers in the next few years. this will improve f layer propagation on the lower amateur frequencies, at the expense of the higher bands. though this summer has been poor for sporadic e activity on 28, 50 and 144 mhz, this is not necessarily the result of declining sun spot numbers and lower solar flux. the w6jkv 50 mhz expedition to greenland this past week produced a surprising number of qsos over a greater expanse of territory than had been expected. then at the weeks end, there was a surprise transatlantic opening to the channel islands from northeastern u.s. and adjacent canada. reception of the gibraltar 6 meter beacon zb2vhf, and the british beacon gb3six, was reported over a wide area in this country.

for the forecast week, generally poor hf conditions are expected through july 5, improving july 6 and july 9 to 12.

american sunspot numbers for june 21 to 27 were between 39 and 54 with a mean of 47.9. ar

What separates Amateur Radio from Children's Band is not the increased
technical knowledge. C'mon, the written exam for the so-called general
license doesn't assure any great level of technical competance. The difference
between ham and CB is effort. You have to spend some type of effort to get
your license, unlike just mailing back the form when you buy your radio (if
the average CBer even bothers to do that).

-Ron

Re: all of the complaints about the stuff on net.ham-radio

First, yes, I read the bulletins. Not all are of interest to me,
but I appreciate the service that rjr and the others provide.
Keep them coming, at least they pertain to ham-radio.

Second, won't idiots ever get tired of complaining about the morse
code? The fcc decided that it will be a fact of life for a while
anyway, so learn to live with that. And, yes, I do have a key jack
on my 2m radio, and I do use it.

Thirdly, if you want to complain, I vote we get rid of all of the
scanner crap that is on the net. That's not ham radio.

Sincerely, Dave

:-)

I didn't attack anyone personally and I hope no one felt that way.
I only asked a question (sarcasticaly, sorry) and voiced an opinion.
Several people responded with good arguments for getting rid of
code in the upper freq's but I haven't seen any good arguments for
keeping the requirement, maybe there isn't one. The idea of my
learning code isn't the subject, as I've already learned it and then
stopped using it. I don't recall the writers name but (s)he used the
comparison of learning the bit patterns of ASCII or BAUDOT in order to
operate on ham radio. This was well put.

As an ex-ham who worked CW exclusively (~30wpm) I vouch that it can't be beat for inexpensive, reliable communications. But as far as the code requirement goes - it serves little purpose.

Certainly, it keeps out the CBers. But wouldn't a more difficult technical exam be just as effective? And as for emergency communications, how much proficiency is needed to copy QRRR or SOS at 5WPM and call the authorities? Even the most die-hard, 60WPM, CW op would slow down to make sure his distress signal was copied.

The fact is, one no longer needs to know the code to use it. For $100 a box can be had which will turn a home computer into a RTTY/Morse terminal. It's true that the box needs a higher S/N than a good operator, but you can't beat it for armchair copy.

So I move that code requirements be dropped to 5WPM and the technical requirements raised. Then maybe every ham will know enough to keep his modulation <100% and all those 5WPM distress now obscured by splatter could be copied! :-)

Jim

The current ARRL DXCC country list follows. A number of corrections, changes and additions (of secondary prefixes) have been made since the earlier posting. Thanks to Ron, W2IOL, for many of the changes.

The colon-separated fields are:

1. primary prefix
2. country
3. continent
4. ITU zone(s)
5. CQ zone(s)
6. other prefixes, if any

For my own use, I added a first field containing a symbol
for status (- for worked, # for QSL received, etc.).
With programs such as sort, awk and grep, one can use the file
for printing lists by prefix, country name, continent, etc.
Please send corrections and suggestions to me.

NO-CODE will turn the 2 meter and possibly 40 cm bands into a junkpile.
Those that think a tough technical test should remember how many books
are out there to help people pass the present technical tests, all the
way to extra.
   I knew of a woman, totally non-techninical, who went and got a First
Class ticket by reading a book. She did this back in the late 60's
because she was working a night shift at a radio station, and this would
help keep the costs down. Do you think she would have been able to
perform any First Class ticket functions if required? They told her
what to do, and to have her call the engineer if anything happened.
   I was one of those who complained about the code requirement for
years until I sat down and did it. When you realize that 5 wpm is only
one character in about two seconds, all you have to do is learn to

recognize the characters and numbers of the code. Two seconds is a fairly long time to recognize a character.
   At least it shows that a person is genuinely interested in the service. Also, for those that think that code doesn't get used on VHF, there are many places where the code is used. For one, it identifies most of the repeaters that are in use. When in an unfamiliar area, this may be the only way to know which call sign for the repeater is current. Also, those repeaters that have autopatch capabilities usually send the number information back in code as a check prior to dialing the number.
   Code exists most everywhere in Amateur radio, and you only have to listen to find some.

Hey, why doesn't somebody else start a riot by tossing out another controversial topic (like the code / nocode argument) to see what happens.

Lessee, what's a good topic ? I know, how about this: are DX nets a good thing or are they really rotten? That ought to get some comments!

-de W3IKG

I really suprised the control stations on our repeater system here in
Baltimore that I noticed they changed the Call Sign on the repeater.
Not many people notice the morse code identifier changed. I don't think
many can copy it.

Peter allan,
   1 WPM would be too much to ask for! Even 1 word per week gets my
anger when you require it. I think the requirements to get a licsense
should be to build your own station or be able to fix your radio instead
of sending it back to japan. But this is just as rediculas.

I for one find the scanner freqs in the VHF-UHF area useless but keep them
comming, I save them all and pass them on to those that are interested,
I feel that for every one who complains, there are ten who have a different
opinion.

I once had my HAM license, but gave it up after deliberate jamming on 40
meters, it kind of took the fun out of it.

I have ordered my own set of FCC microfiche and being an avid HF listener I
find such data of much interest. Maybe I could help contribute when my
fiche arrives (here at TEK all net.flame is trashed).

Alright, I confess, I've never learned code. Perhaps that's one of the few reasons I am not a ham at this moment. But while I don't want to take on the establishment and all that implies, I am a little bothered by the "keep the hobby clean" attitude.

Yes, I agree, let's keep the idiots off the air. As a pilot, I am similarly interested in keeping idiots out of the sky. But I don't believe in the "I had to do it, so you have to do it also" attitude. It's too damn self-serving. If anything, I notice aviation magazines increasingly alarmed at the growing difficulty of getting an airmans certificate, worried that too many people are being scared away from aviation. How exclusive do you want amateur radio to be?

I found the comment about CB quite telling. No, I'm not one, but I read a most interesting comment in net.auto. In an article entitled something like "an inexpensive radar detector", the author touted the advantages of CB as a radar detector (channel 19 or thereabouts) and in emergencies. The author also pointed out that the crap that congested the airwaves during the height of CB's popularity has, by and large, disappeared. In other words, the problem pretty much corrected itself once people got over the novelty of being radio operators.

Times have changed. Amateur radio operators are no longer blazing the trails they once did. DX'ing halfway around the world, while still not trivial, is about as innovative as, well, crossing the Atlantic. I've done the latter in a 747 and it's *really* dull. I hope I'm not being too critical in suggesting that amateur radio has passed its pioneering days in every way except in attitude. Maybe it's time to rethink the code requirement and ask whether it still belongs.

Come to think of it, are they still asking questions about triodes on the tests?

x
New Kenwood Amateur VHF/UHF Gear to be Announced

Kenwood will soon announce a series of new VHF/UHF radios for the amateur. Among these will be the TR-2600, a 2 meter walkie-talkie with continuous receive coverage of 140 - 160 MHz, allowing monitoring of some military, public service, and business frequencies. This radio resembles the TR-2500 physically, but has a more colorful front panel. Traditional programmable CTCSS will be optional.

The TR-2500 will contain a new Kenwood designed digital squelch system. From what little information I've seen, it looks like one's call letters, among other information, will be sent in ASCII during each transmission. An optional, outboard accessory 1 line LCD display will permit display of these call letters. This appears to be a new form of selec- tive calling scheme for amateurs.

Other new Kenwood offerings will include:

o+ A new 2 and 3/4 meter combination FM transceiver, smal-

ler than the present TW-4000

o+ a new low cost series of 2 and 3/4 meter walkie talkies with thumbwheel switches (a la the ICOM 2AT and Yaesu FT203R), with much hype about robot manufacturing technology and chip components

o+ a multi-mode 2 meter transceiver that looks like the TS400.

Watch QST and other publications for details and pictures.

Are there any Amateur suppliers (e.g. Ham Radio Outlet, etc) which stock the TAPR TNC Boards? I would prefer a dealer that will accept plastic money & telephone orders.

Thanks,

Rick, WB2CFV

PS. I know about the AEA PKT-1 board - it is too expensive ($589), and is not yet available.

Right on, Pete. Andy, I enjoyed your pitch also. Also the suggested new exam questions from Mike, K3MC, which however I thought were not sufficiently demanding if they were intended as a substitute for Morse code proficiency.

I also lament the dearth of "real" hams these days who can wire up fully synthesized full-duplex quadraphase multiplex SSB transceivers out of parts from an old discarded telephone handset. Or even fix their own equipment when it breaks.

My own reply comments to the FCC, though stressing the emergency communications value of the code, also allowed as how a code-free license might not be too bad if it substituted a tough technical examination and if it restricted operations to the less crowded bands above 220 MHz.

Since the issue is dead at the FCC for now, I submit that it would be constructive for us all to shift our energies to the task of encouraging and helping newcomers to the hobby to get past the code requirement.

For example, does anybody out there have a code practice program that will run on reasonable hardware? I have one which is in Fortran and runs on a lot of terminals, using the beeper to generate the sound. Unfortunately this VT-100 won't sustain the beep so I can't make it work on this one. Does anybody know how to modify the VT-100 so the beep timer will "retrigger" without a glitch? Is there a simple timer chip substitution that will do this? I haven't looked into it. The Lear-Siegler ADM-3 worked fine at about 7WPM and the Tektronix graphics terminals would go up to about 20 WPM with very nice keying quality. If anybody would like a copy of the program I would be glad to forward it over the net. (Please allow a week or two for delivery

as I have to locate the tape and get it read in and maybe fool around with format problems.)

If there is any interest, I for one could run some code practice on the air for anybody in the East or Midwest. Also, for Novices or Techs trying to upgrade, I would be happy to make skeds for code practice. I could also be persuaded to record code practice on tape for anybody who wants to send me a blank tape (if demand is not too great).

Is anybody else out there willing to help in these ways? If so, perhaps you could identify yourself to those who could use your help. Let's not make everybody wait 12 years for the FCC to look at the issue again! Let's encourage them to go ahead and learn the code!

<chomp>
I thoroughly agree with W3IKG and others who have noted that CW is the most
effective way to get through in an emergency when one has limited equipment,
minimum power, and perhaps a fair amount of QRN, QSB, QRN and what have you
to go with it.
Lets face it, the reason the FCC (and appropriate organizations in other
countries) have given us the spectrum space they have is because hams are a
national resource and can provide emergency communications.  In addition,
when the conditions are against you in an emergency, you need all the help
you can get, which includes a mode of transmission that can get through best
and that usually is CW.
Regards,
Bill Mitchell, WB2IAU

No, no. Let's really heat things up by discussing the merits of tying up
the bands with large scale contests.

I own a couple different Regency scanners, and have bought and tried another model Regency before giving it to a relative. A co-worker has a Regency which he has discussed with me. I have had a Bearcat crystal scanner and have read some discussions of Bearcat programmables. The other brands to keep in mind are JIL and Radio Shack. Regency, Bearcat, and JIL are all available from discounters and mailorder houses, both true wholesalers and quasi-wholesalers (ones who act like wholesalers but happily sell to anyone, even without a business name), so list prices on all these are meaningless and you should either buy strictly by price comparisons (and be prepared to handle any warranty repairs or problems yourself), or resign yourself to paying more at a local dealer to have someone to handle problems or complaints.

Because of the easy availability of lower-priced models in these three brands, I have never paid attention to Radio Shack, as you have to pay either a fixed price or catch these on sale, and even on sale they are more than the others.

OK, enough intro. My Regency models have all worked fine. All were bought from wholesalers by mail-order, and worked OK out-of-the-box. The models were the K500, K100, and ACT-W-10 with Digital Frequency Selector. All of these are now discontinued. THe K500 has a bunch of pre-programmed frequencies, 40 user-programmable channels, and various features. The K100 is similar with fewer goodies. The other is an unusual model which uses metal combs plugged into sockets on the rear panel which short out a diode matrix for frequency programming, and also an external box with switches to select the frequency for one memory. The K500 & K100 are plagued with a number of birdies, spurious oscillator frequencies which behave like an unmodulated carrier and interrupt searches and prevent reception on those frequencies. Those birdies are my main gripe with

these programmable Regency models. I believe newer models have improved this condition, but I know no details.

The co-worker's Regency (I believe an M400) has been back and forth to the factory for repeated repair of a bad membrane keypad. My K500 has a similar keypad but worked fine. I don't know if it is a "lemon" situation or a difference in subassembly design.

I have read comments regarding the programmable Bearcats in the newsletter of the International DXers Club of San Diego, written by the late Larry Brookwell. (This club is now in limbo following Larry's death in December 83.) Larry had a couple Bearcat models and talked with dealers, and reported a seeming tendency to unreliability. His were back for repair repeatedly, and he reported that dealers said this was common. The crystal Bearcat I had I gave to my mother after getting my first programmable; the audio on it was never clear enough to suit me. I believe that the crystals might have aged or been cut slightly off-frequency.

The JIL models have wide frequency coverage, but I believe they all use external plug-transformer power supplies, which I dislike. I have no info on their performance or reliability.

Based on the above, I continue to recommend Regency. I may buy a Bearcat if I could get a big enough bargain, though, just to try the different design and approach. None of my scanners have the aircraft band, and I would like to have this. However, I do not think that it is as popular as the other ranges, for several reasons. 1) It is AM, not FM, which adds circuitry and cost to the scanners that have it; 2) Unless you are an aviator or aviation buff or live near an airport, there is little to be heard except aircraft in flight, which transmit briefly on many different frequencies and who seldom say anything interesting, unless you luck out in hearing a skyjack or disaster. However, having that band is necessary to using scanner accessories, such as the "Globe-Scan" shortwave converter, which lets you use your scanner as a digital-readout shortwave receiver, or the "Scanverter" which converts the military UHF 200-400 MHz range to the aircraft band. (Both of these are from Grove Enterprises.)

Whew! Hope the above was of interest!

Will

x
       At last count, there were about 21 scanners here (got
       another   one yesterday) of various brands, not all on at
     one
       time! I   have serviced Regency, Bearcat, Plectron, Sonar,
       Radio Shack, Craig, SBE, Motorola, and Heathkit monitor
       receivers to name a few, and still have 2 Tennelecs waiting
       for attention which they will probably never get.

       Scanner features often differ not only by model but
      by
       manufacturer.   For instance, Bearcat programmables allow
       enable/disable of the delay function on a per-channel basis.
       Regency   only permits the delay to be enabled/disabled glo-
       bally, that is, for all the channels at one time.

Both Bearcat and Regency, as well as Radio Shack offer some good models. Stay away from the Bearcat 100, and scanners made by JIL, Fox, Tennelec, and Robyn.

In the name of cost cutting, some newer models have done away with the concept of a "channel bank", i.e. the ability to select/deselect a group of channels at a time. The bank concept was a good one. It may be inconvenient to operate a 30 channel scanner without banks (e.g. Regency MX3000, HX1000A) if you operate the way many scanner hobbyists do.

Heath's new scanner is really a Bearcat 20/20 in semi-kit form, and should appeal to those who want to monitor the commercial aircraft band.

Bearcat was just purchased by Uniden, maker of radios and cordless telephones.

My favorites are the Bearcat 300, the Regency M400 (just discontinued), and the Regency K500 (predates the M400).

From the University of Surrey.

The following text is reproduced from one of our datasheet handouts, in response to a couple of requests for the latest revision of Oscar-11 telemetry equations.

UoSAT-2 Telemetry Data Format

The telemetry system collects 60 analogue values from around the spacecraft, digitises them and sends the results, together with 96 status points, a 'UOSAT-2' identifier and the time, to the beacon multiplexers as a serial ASCII stream. The data is transmitted at 300, 600, 1200 or 2400 baud, using a standard character format of 1 start bit, 7 data bits, 1 even parity bit and 2 stop bits. There is no Morse code or RTTY available from the telemetry system directly, but these formats could be generated by the 1802 computer. The 2400 baud rate is experimental and can only be modulated using a different format - a separate datasheet will explain this.

A typical 'frame' of data contains 7 rows of 10 'channels' of information. This is illustrated below:

```
UOSAT-2           8405174112923
00380 01370 02661 03481 04059 05046 06027 07056 08040 09033
10512 11357 12000 13089 14000 15000 16000 17487 18467 19572
20523 21061 22659 23000 24000 25000 26104 27483 28600 29544
30435 31040 32283 33000 34000 35378 36434 37460 38529 39539
40855 41000 42674 43000 44171 45001 46000 47528 48541 49509
50569 51073 52702 53295 54990 55000 56000 57535 58532 59535
60800 615BC 62800 63024 64000 65000 66C00 67000 68000 69000
```

The first two digits in each channel are the channel identifier, a decimal number between 0 and 69. Channels 0 to 59 are the 60 analogue values, and the 3-digit decimal number following the identifier is the value 'N' which may be substituted into the calibration equations below. Channels 60 to 67 contain the 96 status points, held as 3 hexadecimal digits, e.g. channel 61 contains bits 13, 14, 15, 16, 17, 18, 19, 20, 21, 22, 23 and 24, with 13 as the MSB and 24 as the LSB. (i.e. 61400 means that bit 14 is set and bits 13 and 15-24 are zero). Channels 68 and 69 are always zero. A 1Eh cursor home character preceeds 'UOSAT-2' in each frame, and the identifier is followed by the date/time in the format YYMMDDWHHMMSS, where W is the day of the week, 0 to 6.

Following experience on UoSAT-1, a checksum character has been included in the telemetry system hardware (rather than using the computer as before). The above frame, with checksums, is as follows:

```
UOSAT-2           8405174112923
00380B0137050266130348 1E040598050467060273070564080 40C090339
10512711357112000313089314000515000416000717487D18467C195728
20523621061422659A230001240006250007261041274 83A28600C29544E
30435131040632283833000034000735378A364346374606385295395395
40855C41000542674343000744171745001046000247528C48541C495091
```

50569F5107305270225329585499015500005600035753515853295953 5F
60800E615BC562800C6302436400026500036 6C00C67000168000E69000F

The checksum characters have been substituted in the place of the spaces following each channel. By exclusive-or'ing the binary (0-15) values of all 6 characters in each channel, (2 identifiers, 3 data & 1 checksum), a non-zero result indicates that the channel has been corrupted in transmission. A zero result, of course, does not guarantee a correct channel!

A dwell format is also available, in which an unlimited number of channels may be selected and displayed in virtually any format, checksummed or non-checksummed. The identifier and time-stamp are optional in this mode.

UoSAT-2 Telemetry Calibration Equations

There is a commercial source for railroad frequency listings; a book
by Tom Kneitel called RAIL-SCAN. The blurb on it claims that it is
"the absolute largest compilation of railroad scanner frequencies
ever published -- 4000 railroad-related listings". It is listed in the
catalog of CRB Research (PO Box 56, Commack, NY 11725), at $7.95 (Item # RS).

This catalog also has many other scanner and communications books,
and some of the standard survivalist and "covert operations" books
sold by many mail-order dealers. (Anybody ever notice that these
books are always sold mail-order, and not in bookstores where you
could look at them first? I believe it's because the sellers
realize that if a customer gets a chance to scan through the book
first, he'll realize it is not worth the $8.95 or whatever the
book costs... Anyway, that refers to the "build your own
submachinegun" books, not the scanner frequency lists, though
they are probably overpriced, too.)

Probably worth dropping them a postcard for the catalog, in
any case.

Will

If your Bearcat crystal scanner was unclear, were you using standard crystals? If you were, that was the problem. I used to be in retail and sold scanners as part of my line. Bearcats at that time used a different IF (10.8 as opposed 10.7 MHz) I don't know if that is still true, but it would be a good idea to check. I know of a few people that just calculated the crystal frequency and then ordered a standard crystal at an offset, like 154.570 when you really want 154.470, or something like that, but it still was off. I think that the Bearcat used different capacitance on the crystal or something. I'll admit I'm not a fan of Bearcat. The only scanner that I like of theirs is there new RS-232 scanner that is computer programmed, but I've heard that the program only comes on the C64 and it is VERY SLOOOOWWWWWWWW! If you wrote your own on another computer, it MIGHT be faster.

Before you buy any scanner, you should look into the features that are not really stressed, but you will have to dig in the manuals for. Things like in search mode, will the scanner track to the center frequency, or will it lock and sit on the edge, giving only a lot of noise.

Personally, I own a Radio Shack PRO-2001, but that was as much a matter of company loyalty as it was the scanner quality back in 1978. However, all loyalties aside, my next scanner will be either the Radio Shack portable programmable or the new Regency that offers CONTINUOUS coverage of VHF and UHF. I haven't really investigated the Regency yet, but I'm interested in the 220 MHz ham band, and it will cover it. When I get enough money saved, I'll have to decide if I want portability or coverage, assuming the Regency is up to snuff, quality and feature wise.

<for the one-eyed, one-eared, flying purple people-eater>

I'm a guest to this group, since my interest in scanner radios is to
add to my railroad hobby activity - train spotting and the like.

For my use, the ideal unit would be portable, programmable, *rugged*,
and also useable in a car or home, using external speakers if necessary.
Mega-band reception isn't necessary, since the RRs operate on only a
few bands, such as 160 MHz. Other concerns are signal clarity and range,
and rechargeable battery option.

Are there any situations in which use of scanners is illegal, either handheld
or in a car or home?

Please advise by mail to me below. Sorry if this sounds a bit naive.
I will post the results to net.railroad, and to this group, if requested.

Thanks in advance.

As your questions have been asked by several readers, I shall take the liberty of posting a reply in a followup article.

Since you want a programmable, rather than crystal controlled, portable scanner, you currently have 3 choices:

1. Radio Shack PRO30: 16 channels, list price about $300, batteries and AC adapter/charger optional. Watch for a sale. Widest frequency coverage, also includes commercial aircraft band. Plastic case. Internal speaker is rather weak, but the audio stage has sufficient power to drive an external speaker to high volume levels. (I own this unit and am very satisfied with it.)

2. Bearcat 100: Early models had extremely high failure rate. Keyboard design allowed key to recess too far, and be "lost" underneath the front panel. Problems in physical design caused intermittant battery contact, thus resetting microprocessor controller. This problem was corrected in later models, which may be recognized by the BNC antenna connector, and appear to be more reliable. Usually discounted to $289, but may be found as low as $239. Includes leather case, batteries, charger/adapter. No priority channel. Several Bearcat 100 owners in this area are trying to selling their units and replacing them with PRO30s.

3. Regency HX1000A: 30 channels, with built-in digital clock. Discounts at $180 - $220, including leather case, battery, charger/adapter. Very new, too early for any evaluation. Could be the most rugged of the three programmable, portable scanners.

Carrying the scanner in a decent leather case goes a long way towards protecting the radio. Since Radio Shack offers no case for the PRO30, I use a husky case made for a Motorola walkie talkie, purchased from a 2-way radio shop.

If you are content to listen to 6 - 8 channels or less,

you could buy a crystal controlled portable scanner, which may be a bit more rugged, and a good deal smaller than a programmable one.

Some states have enacted restrictions on the mobile use of scanners. It is against the law in New Jersey for John/Jane Doe to have a radio in the car capable of intercepting police signals, without written permission of the chief of police in the town in which the vehicle is being driven. This law also precludes one from using a portable scanner while in a vehicle, and is enforced religiously in some New Jersey towns. A friend was stopped by the Police in Norwood because he had a 19" whip antenna on his Chevy.

Indiana has a similar law, but exempts licensed amateur radio operators (hams).

I bought the FCC microfiche listings of the licensees on file as of January/February 1984. It is a tremendous source of information for those of who listen to scanners; however, it uses a two letter FCC service code and I do not have the key to the code. The Radio Shack "Police Call Radio Directory" lists some of these codes, as shown

below:

```
      Code - Meaning
     AA
     AF
     BA - Remote Broadcast Pickup (radio & TV stations)
     BF
     BS
     CA - General Mobile Radio Service
     CB - Citizens Band (class D)
     CC - Citizens BAnd (class C)
     CD
     IB - Business
     IF - Forest Products
     IM - Motion Picture Industry
     IP - Petroleum Industry
     IS - Special Industrial (construction, farming, etc.)
     IT - Telephone Maintenance
     IW - Power and Water Utilities
     IX - Manufacturers
     IY - Relay Press (newspaper reporters)
     LA - Automotive Emergency (tow trucks)
     LJ - Motor Carrier, Trucks
     LR - Railroad
     LU - Motor Carrier, Buses
     LV
     LX - Taxi
     MC - Maritime Limited Coast (private stations)
     MG - Maritime Government (Coast Guard)
     MP - Maritime Public Coast (marine telephone)
     MS - Maritime Shipboard
     PF - Fire
     PH
     PL - Local Government
     PM - Medical Services
     PO - Forestry Conservation
     PP - Police
     PS - Special Emergency
     RA - Mobile Telephone, Aircraft
     RC - Mobile Telephone, Radio Common Carrier
     RT - Mobile Telephone, Landline Companies
     SV
     XR
     ZA
```

If anyone on the net knows the meaning of any of the above codes with blank meanings, or how to get a complete listing of codes and meanings, please mail me what ever information you have.

Thanks.

I filled in those codes marked with a *

Code - Meaning

* AA - Airlines - airport ground operations
* AF - Commercial & Private Aircraft (in-flight use?)
* AR - Airlines
    BA - Remote Broadcast Pickup (radio & TV stations)
* BF - FM Commerical Broadcasting
* BS - AM Commercial Broadcasting
* BT - Television Broadcasting
    CA - General Mobile Radio Service
    CB - Citizens Band (class D)
    CC - Citizens Band (class C)
* CD - Common Carrier Paging (?)
* CF - (microwave link?)
* CX - (Cable TV microwave link?)
* GB - (800 MHz business?)
* GO -
* GP -
* GX -
* GS - (800 MHz trunked systems?)
    IB - Business
    IF - Forest Products

```
     IM - Motion Picture Industry
     IP - Petroleum Industry
     IS - Special Industrial (construction, farming, etc.)
     IT - Telephone Maintenance
     IW - Power and Water Utilities
     IX - Manufacturers
     IY - Relay Press (newspaper reporters)
     LA - Automotive Emergency (tow trucks)
     LJ - Motor Carrier, Trucks
     LR - Railroad
     LU - Motor Carrier, Buses
*    LV - (Motor Carrier inter-urban?)
     LX - Taxi
     MC - Maritime Limited Coast (private stations)
     MG - Maritime Government (Coast Guard)
     MP - Maritime Public Coast (marine telephone)
     MS - Maritime Shipboard
     PF - Fire
*    PH - Highway Maintenance
     PL - Local Government
     PM - Medical Services
     PO - Forestry Conservation
     PP - Police
     PS - Special Emergency
     RA - Mobile Telephone, Aircraft
     RC - Mobile Telephone, Radio Common Carrier
     RT - Mobile Telephone, Landline Companies
*    SV - Service (column heading on the microfiche?)
*    XD - Experimental
*    XR - Experimental
*    YB - (800 MHz trunked systems?)
*    YO -
*    YP -
*    YX -
*    ZA - General Mobile Radio Service (GMRS = Class A CB)

> Bearcats at that time used a different
> IF (10.8 as opposed 10.7 MHz) I don't know if that is still true...

     Yes, it's still true. The first IF frequency in crystal
     controlled Bearcat scanners is 10.8 MHz. The synthesized
     bearcats have first IF's of 10.8 and 10.85 MHz (e.g. early
     and late BC-250).

> The only scanner that I like of theirs is there new RS-232
> scanner that is computer programmed, but I've heard that the program only
> comes on the C64 and it is VERY SLOOOOWWWWWWWW! If you wrote your own
> on another computer, it MIGHT be faster.

     The Compuscan (TM) demonstrated to our club was driven by
     an IBM PC. This setup operated about as fast as a BC-250,
     a reasonable speed.
     A review of the Compuscan in Monitoring Times complained
     of slow performance when a C64 was used as the controller.
     The receiver board in the Compuscan is the same as used
     in the BC-300 and BC-350. The feature board differs in
     these scanners.

:-)

I would like to start an argument on net.ham-radio as it
seems there is no food for thought on this note.
  The subject is no-code on 50 Mhz and up. I believe the
requirement for an amatuer to learn morse code for these
frequencys is pure hogwash. The number of radios available
on these frequencys is more than enough to eliminate the
need. When was the last time you saw a jack on a two-meter
handheld that said 'key' on it? The poor users couldn't do
morse if they wanted too. The above statement refers to the
fact that in this day and age the only concievable purpose
of morse would be for emergencys when your microphone broke
and for practice to maintain currency. Wayne Green says if
hams want morse than by god they better be current and able
to operate with it. A person should retest every year and
even be required to show a speed improvement also. I believe
this would be fair. My interest is in microwaves and I just
don't see where the ham community would benifit from my
knowing morse code. Hell you guys don't use morse actively
up on these frequencys anyway.
   Don't send me any mail on this subject but go ahead and
start arguing (sp?).

NASA Chooses AMSAT's WA4SIR For Shuttle Science Mission

Apparently the Hams-In-Space theme will have periodic reprise throughout
the second third of the decade as NASA has selected Dr. Ron Parise, WA4SIR,
to fly as Payload Specialist on at least 2 future shuttle missions!

Ron was notified on 11 Jun 84 of his selection. In an exclusive interview
with ASR last week, Ron indicated he had applied for the position in Sep 83
and was delighted at his success. He is anxious to include Amateur Radio
activities in the mission although he cautions, "This will be a crew-intensive
mission" referring to the projected March 1986 planned launch of Mission 61F.
The 61F mission will be a further flight of the Spacelab series.

Dr. Parise is an astronomer with a PhD from the University of Florida (1979)

and is 33 years old. He has been a licensed amateur since he was 11 having held prior calls WN8JBR and WA8MHD. Ron is a native of Warren, Ohio, is married and has a young son. He and his wife, Cecelia, are expecting another child.

The newest astronaut-selectee is employed by Computer Sciences Corporation in their Systems Sciences Division and currently lives in Silver Spring, Maryland not far from AMSAT Headquarters. Ron is an active AMSAT member and frequently gives talks and presentations on science aspects of OSCAR. He has been AMSAT's Science Coordinator for the UO-9 mission. Computer Sciences is under contract to NASA and in fact Ron works at the Goddard Space Flight Center at Greenbelt, Maryland.

The 61F mission will carry the ASTRO 1 experiment in its Spacelab section. This experiment is sponsored by NASA's Office of Space Science Applications and involves an ultraviolet imaging telescope. Ron helped design the instrument and will be aboard to operate it and collect data. He also is involved in two later follow-on experiments known as the "Hopkins Ultraviolet Prime Focus Spectrometer" developed in conjunction with Johns Hopkins University and the "Wisconsin Ultraviolet Photo Polarimeter" developed in conjunction with the University of Wisconsin. ASTRO 2 (Hopkins Spectrometer) is due for launch in Nov 86 while ASTRO 3 (Wisconsin Photo Polarimeter) is slated for Jul 87. Ron indicates his contract with NASA calls for him flying two missions and being a backup for the third.

Regarding his operating Amateur Radio from the shuttle Ron says he is "enthusiastic" and looks forward "to bringing some radios aboard". Ron says he will support proposals to NASA for Amateur Radio activity on the missions he will be flying but because of intense preparations for the science aspects of the mission, will be unable to spearhead the proposal effort. He indicates full support for the premise without hesitation, however.

The Amateur Space program has its roots firmly planted in space science. AMSAT is a remarkable alloy of scientists, engineers, educators and layman reflecting the very best in Amateur Radio. We are justly proud that "one of our own" has been selected to carry space science further along new paths and will be carrying Amateur Radio along just to keep in touch! Congratulations to Ron, WA4SIR! (And to us, too).

Dr. Tony England, W0ORE, is due to fly the shuttle in March 85 and an ambitious proposal was jointly submitted by ARRL/AMSAT recently to permit Tony to follow the lead of Owen Garriott, W5LFL, and Owen's historic 1983 premiere Ham-In-Space effort.

In case anyone cares, those new wide-coverage Regency scanners are
actually another Japanese-brand line with Regency nameplates applied.
There was some discussion in Monitoring Times a few issues back; I'll
try to remember to look up what the real manufacturer's name is.

Will

PS Re the "unclear" Bearcat crystal scanner -- that was the first
scanner I bought, when I was young and naive, and the
crystals were those procured and installed by the dealer before
I received it. Have no idea from whence they came... WM

You may not get anything out of them but some people do, I'm sure.
Even if they don't want all the propagation forecast, they still might
want to be informed as to what foolishness Wayne Green is up to with
the FCC now. Is ignorance your best excuse???

My God, two notes is a row, the first one trying to start an argument and
he even used Wayne Green as a reference, then he wants us to bury our head
in the sand.

All I can say is, if you wanted to start an arguement, you certainly
did good picking Wayne Green to back you up.

Uniden Corporation acquired the Bearcat division of Electra Company on May 28, 1984. According to an article in Monitoring Times (July 1984, pg. 2):

"It is safe to assume that several new products, including a BC-100XL with aircraft band, a BC-450 wide coverage scanner, and a BC-210XLT with 800 MHz, will never see the light of day."

"Presently manufactured products which have been canceled include BC-250, BC-300, CompuScan 2100 and the new TV satellite terminal."

"Sources close to the company revealed that approximately 120 employees were laid off Friday, June 1, 1984....."

New 200 Channel Computer-Controlled Regency Scanner

According to an article in Monitoring Times (July 1984, pg. 9):

"With the MX-7000 25-1200 MHz scanner barely ready for shipping, Regency announced the impending release of the MX-8000, a 200-channel scanning system with excellent graphic menu using the NEC PC8801 MK-II microcomputer."

"While no price or availability was announced, the preliminary specifications are very impressive. A visual spectrum display is shown on the screen indicating the frequency, channel, bandwidth, mode and other characteristics programmed into the computer-controlled channel selection...."

qst de k9eui

hr propagation bulletin nr 25 from arrl headquarters newington ct june 18 1984 to all radio amateurs bt

after several days of solar flux levels in the low 90s, solar activity began to rise on june 13. by the 15th, the flux was up to 114. present indications are for gradually lower readings during the forecast week and through the end of june.

the level of geomagnetic activity is the main propagation factor at this season, especially in our northern states and adjacent areas. on this basis, fair to poor propagation is predicted through june 20, improving to fair to good through the 28th.

the early part of the arrl fd weekend should have good summer conditions on our lower frequencies in areas not plagued by thunderstorms. the usefulness of 21, 28 and 50 mhz will depend to a large extent on sporadic e layer ionization which peaks in late june. short skip, often with high signal levels, can break out suddenly, so field day teams keep continuous watches on these bands, especially 28 and 50 mhz. e skip is most common in late morning and early evening hours local time, but it can show up at any hour. stable, calm weather makes for above average signal levels and extended range on 50 mhz and higher frequencies.

american sunspot numbers for june 7 through 13 were between 22 and 45 with a mean of 30.9. ar

hr dx bulletin nr 22 from arrl headquarters newington ct june 21 1984 to all radio amateurs bt

tristan da cunha. according to his qsl manager, w4fru, andy, zd9bv, lost all of his antennas in a windstorm. andy now has an inverted vee up for 40 and 15 meters. he should be active on 7080 khz listening around 7160 khz at 0730z. he will probably not be back on 75 meters until sometime in july.

marshall islands. kx6ds is very active on 40 meters, usually around 7002 khz at 0900z.

solomon islands. h44ia has been active on 3795 khz at 0900z, with good signals in the eastern u.s.

cambodia. xu1ss is still active around 14335 khz at 1200z on sundays in a list operation.

crete. ka0cyr/sv9 occasionally shows up on 7005 khz at 0245z for a u.s. schedule.

qatar. a71bk, mohamed, has been worked on 14185 khz at 2300z.

liechtenstein. df4gv/hb0 has beenhactive on 7003 khz at 0300z and will be on from liechtenstein until sunday morning.

egypt. herb, ka4sbe, continues to be active on 20 meter ssb on 14245 khz at 0230z.

turkey. ta1as can sometimes be found on 14220 khz at 2300z.

east kiribati. t32af has a new beam on 40 meters and is frequently on 7075 khz at 0815z testing it, and plans to be doing this frequently for the next two or three weeks, listening in the u.s. phone band. qsl via kh6ur. ar

Stop the bulletins and bring up no-code discussions from the depths
of net.ham-radio (or, at least dialogue from a few months back)???!!!
Whats up??? KEEP THE BULLETINS COMING, some of us dont have the
time (or the ability) to catch them all via other means

I appreciate rjr's posting of the arrl bulletins, and would like to
see it continue. I find the majority of the bulletins uninteresting,
but a few important ones make up for that. Perhaps rjr could add
a word or two to the title line that would suggest the content of
the bulletin. I would skip anything marked '3rd-party traffic', for ex.

mpackard, don't forget the power of the 'n' key.

Is this "radical chic", or just poor judgement?
Congratulations, you have just used the net to advocate
the breaking of federal and international regulations:

+ FCC Rules & Regulations:
- R&R 89.51 - Station Authorization Required.
- R&R 89.117 - Acceptability of Transmitters for Licensing

+ Communications Act of 1934:
    - Sec 324 - Use of Minimum Power

+ International Telecommunications Commission Convention 1947:
    - Article 44 - Harmful Interference

+ International Radio Regulations Annexed to the International Telecommunications Convention 1947:
    - Article 13 - Unnecessary transmissions and superfluous signals
    - Article 22 - Station license

+ Geneva Treaty 1959:
    - Article 1 Sec 3 - Harmful interference

I hope you don't hold amateur or commercial licenses.

...Bob
(FCC Radiotelephone Operator's License P2-18-37775/Radar Endorsement)

I really didn't want to start something here in this news group when I think that "mpackard" should really be ignored, but since I was the object of the "Stop the Bulletins" flame, I will most certainly respond to it here!

BURNER ON

I could say "Hey, April 1st was a couple months ago" or "Why are you criticizing amateur traffic from ARRL when you don't appear to be a ham (at least I didn't see any call sign - let alone your name)" or "Are you related to Wayne Green?".....

After reading your comments on no-code I will say that ham radio might not benefit from having you on the air at all , regardless of whether you use Morse code or not!

As someone else suggested, and I have seen it in other news groups as well, what's wrong with using your "n" key to skip over the stuff you don't like to read? I sure as hell don't read everything either but I don't flame everyone just because

I am not interested in their items!

BURNER OFF

I think Wayne Green's proposal was the most horse-crap idea I have ever seen, especially to be sent to the FCC as a petition. On the other hand I will say I like Wayne. I don't agree with him a lot of times but you have to admit, he does get you thinking.

I don't always agree with the ARRL either. Previous to Wayne's petition, I think the most idiotic idea was the League's incentive licensing plan, which we have today. It would have made much more sense to allocate priveledges according to what modes one qualifies for by taking a test for each mode. Naturally, then, the more modes you are qualified in, the more spectrum you can use.

I agree with the basic idea of why have code a requirement on VHF. However I don't think the same spectrum/priveledges should be available for those that have not passed the entire amateur exam. The FCC stated that one way or another, there will be some kind of hobby radio service available that will require an exam but not require a code test. We shall see what happens.....

Hey there Bob (AJ9S), keep those interesting frequency lists coming.

Thanks to all of you for your encouragement on the bulletins. I wouldn't send them if I didn't think there was interest. I will look into a way to possibly give a brief description in the title line concerning the content. Tnx for that suggestion.

The reason you don't see alot of arguing on this net is that this is not CB. The majority are interested in exchanging information on various aspects of the hobby or help newcomers as yourself get started. I didn't get into the hobby until recently because I "didn't have time" to learn the code. Two years ago, my 13 year-old daughter enrolled in an electronics class in school which would lead to a novice license. I got on the stick and got my ticket, then upgraded. She got her license and worked her first Field Day contest. My older daughter and wife also now have their tickets. Are you going to let THEM show YOU up????? Come-on!!!! Find a ham at work or in your neighborhood. Join the crowd. You are very welcome.

> - ihnp4!ihuxf!parnass - (312)979-5414
> (FCC Radiotelephone Operator's License
> P2-18-37775/Radar Endorsement)"

From the quoted exerpts, it SEEMS as if Mr. Parnass and I have read the
same article, but our reactions are totally different.

I did not see any details that would enable anyone to build a RADAR
jammer if the builder did not already have the knowledge to do so;
all I saw was a general description of the principles involved.

Further, I don't agree that the original poster has "just used the net
to advocate the breaking of federal and international regulations."
I saw neither advocacy nor encouragement; indeed, I saw cautions and
warnings of the penalties for using a jammer.

Maybe we weren't reading the same article.

KEEP the bulletins. DON'T even start the no-code discussion again.
And if the perpetrator of the original two messages is so short sighted
as to assume that what he is doing is the only thing of interest in
ham radio then it sure ain't any wonder that he quoted Wayne Green.

I'd be happy with a more thorough technical test to separate those who
REALLY know radio & electronics theory from those who Bash their way into
ham radio.

The basic idea of the code is to keep the hobby clean-- unlike CB. While
the code test has served that purpose in the past, a comprehensive technical
test could be used today, when knowing ASCII is more useful than morse code.

When the more sophisticated systems fail, almost anything can be used to generate Morse code. The point of the req. to know it is to ensure that those granted privs to use the bands will be able to deal with the kind of real emergencies that occasionally necessitate such a mode. The ASCII analogy does not apply. If you want substantiation that such events have actually occurred, just read QST, for example. By the way, although I got my commercial license (radar endorsed) without difficulty many years ago, it was years after that until I got sufficiently code-proficient for an amateur license,, so try not to class my comments as merely trying to exclude those for whom it is a chore to learn the code.

To have Morse or not to have Morse that is no longer the question.
Morse is here to stay. I do not think 4 Hrs of work and $4.98 for a
cassette is too much to ask for to qualify for a Ham Licese. The Boy
Scout Merit badge award requires 5 WPM, so you guys out there want a Ham
License that has less of a requirement than a Boy Scout Merit Badge ??

Oh, Oh, there I go again. Sorry Guys.

                  Joe N2XS "Spark Forever"

PS I still think tubes are classy

I too, must say I like the bulletins being posted, particularly the dx and
propogation forecast bulletins.

I redistribute these locally to some of the Ham BBS's, and the response has
been totally positive!! Folks love 'em, particularly since most folks
don't get to copy them directly.

Keep em' coming!

Ref. - recent ARRL bulletin # 50 (below):
---

    qst de k9eui
    hr bulletin nr 50   from arrl headquarters   newington ct
    june 22 1984   to all radio amateurs bt

    the efforts of radio amateurs in meeting the challenge of
    emergency communications readiness through participation in the
    1984 american radio relay league field day and in the exercises
    sponsored by the national communications system are greatly
    appreciated. your communications skills are a vital resource
    to our country.

    signed, casper w. weinberger, secretary of defense. ar

The amateur radio service is NOT handed all that spectrum just for our amusement. The PRIMARY justification, in the face of a LOT of competition, for all those Megahertzes we call home is that we are a major emergency communications resource. Both us as operators and our equipment.

Read the back of your license, last sentence, for further clarification.

Morse code, with the most sophisticated signal processor known to Man (the human brain) as receiver, is well known to be able to "get through" under many kinds of highly adverse conditions in which most other modes fail miserably.

Morse transmitters can be "jury rigged" in the field out of junk parts in an emergency. Like a battery and a roll of wire. (Try to build a

computerized ASCII terminal starting with those resources!)

I know of one recent case (circa 1980) in which two people were rescued from virtually certain death after an auto accident because one of them happened to be a ham and happened to be able to send Morse code using the touch-tone pad on his 2 Meter FM rig. I never learned just why he couldn't use voice; probably either his injury or that of the microphone prevented it. But if he had NOT known Morse, two people would now be dead unnecessarily. (Details available on request -- it was a pretty dramatic incident.)

Morse IS a bit of effort to learn, and can't effectively be taught quickly in an emergency situation.

For all these reasons, it is in the public interest that ALL of us be coerced, wheedled, conned, tricked, and/or otherwise forced into learning the code whether we are interested in doing so or not. The only exception I would support is for people who REALLY are medically impaired in a way that makes this impossible or an undue burden. And I think when one looks into this, that's a VERY small fraction of those who seek relief from the code requirement.

It is also in our PERSONAL interest, because knowing the code could (as in the case mentioned above) save you own personal life someday.

Besides, Morse code is actually FUN, like skiing or ice skating, once you stop grumbling and get some proficiency in it. And the way to do that is to USE it, just for fun, once in awhile, even if your main interest in ham radio lies somewhere else. Get into a CW "ragchew" from time to time. This takes away the drudgery of practice and makes it actually interesting. HINT: As with tennis or chess, you progress the fastest when you work with an "opponent" more skilled than yourself.

qst de k9eui
hr dx bulletin nr 20 from arrl headquarters newington ct
june 1 1984 to all radio amateurs bt

thanks to w1trc, k1xm, k1mm and the southern new england dx association for the following dx information.

tonga. nick, a35mo, has been worked on 7178 khz at 0900z. he plans to be active the next 4 wees, especially on 40 and 80 meters. qsl to his home call, zl1axu.

chatham island. ron, zl7amo, will be winding up his operation on chatham within a week. look for him on 21310 khz at 0200z, 20 meters between 0330 and 0500z, 40 meters at 0530z and at 0900z for 80 and 160 meters. qsl to his home call, zl1amo.

rwanda. look for 9x5wp, wes, on sundays from 1900 to 1930z around 21275 to 21280 khz. qsl to wb6vkd.

niger. look for a dxpedition signing 5u7ld this weekend or possibly next weekend. check the usual dxpedition frequencies and 14175 khz at 1930z. qsl to in3rzy.

south sudan. tl8ge/st0 has been showing up on the international dx association net on 14236 khz at 0300z.

wallace island. fw8af, francis, has also been worked on 14236 khz at 2330z.

liechtenstein. da1wa/hb0 expects to be active until next monday, especially on 40, 80 and 160 meters.

thailand. hs4ams was heard last weekend on 14227 khz at 1300z, working the midwest.

solomon islands. h44ia is quite active on the weekends. look around 14200 to 14230 khz betwezn 1200 and 1300z.

west malaysia. 9m2hb is a periodic visitor to the w7phl net on 14226 khz at 1430z.

bahrain. a92eb, christian, is active on weekends on 21335 khz at 2000z. qsl to k0lst.

nauru. c21bd, det, can be found on 14220 to 14250 khz from 1200 to 1400z.

brunei. v85hg, whose old call is vs5hg, is active on 14200 khz at 1400z. he will make skeds for rtty.

heard and worked,

callsign	frequency	time heard
5z4ed	7010 khz	0250z
5b8wj	21300 khz	1015z
ve7lb/kh8	7196 khz	0930z

Before I moved to the Portland, OR area (I gave my HF transceiver to
my father in WVA), I used to be somewhat active in "CARI." That
stands for Chess Amateur Radio International. It's a great idea
for combining chess and amateur radio, resulting in truly international
playing for both hams and non-hams. For more information, write to

      CARI
      PO Box 682
      Cologne, NJ 08213

Until I get another transceiver, I am limited to 2 meters in the
Portland area. Any ham/chess players interested in 2 meter chess?

qst de k9eui
hr propagation forecast bulletin nr 23   from arrl headquarters
newington ct june 4, 1984
to all radio amateurs bt

the solar flux average for may was 129.4, but flux values have

been falling since may 21 and the reading for june 2 was 107. in late april we had readings as high as 183, a high for the past 17 months. such peaks have kept the daily average for 1984 at around 127. this is nearly two points above the early 1983 average, despite the fact that cycle 21 is now nearly eight years old.

solar flux values during the past week, 120 to 107, are more like what is expected this late in the cycle, but flux levels are not a major propagation factor during the northern hemisphere summer.

of more interest at this season is the activity of the earths magnetic field, which will be lower early in the forecast week, making for generally better conditions on all hf bands. it will rise again june 5 to 7, resulting in poorer high latitude propagation until about june 8.

sporadic e layer ionization will continue to provide short skip on 28 and 50 mhz, and the chances for 144 mhz will improve.

american sunspot numbers for may 24 through 30 were between 59 and 83 with a mean of 72.1 ar

Subject: Prom Erasure

There are two different kinds of ultraviolet tubes available--short wave and long wave. The kind used to illuminate posters, etc. are long wave.
The kind used to erase EPROMS are short wave. Short wave UV is the component of sunlight which causes tanning (and sunburn, and skin cancer), so you have to be very careful not to look at a short wave UV lamp. I've been using a General Electric G8T5 8-watt germicidal tube with very good results. If you want to build an eraser from scratch then you'll also need an 8-watt ballast and an FS-5 starter. There are some back issues of BYTE magazine which

describe the construction of an EPROM eraser. However, at least one of these articles INCORRECTLY suggests using a long-wave UV lamp. The easiest way (and probably cheapest way) to build an EPROM eraser is to buy the G8T5 tube and put it in an inexpensive fluorescent desk lamp which already contains the correct ballast, starter, sockets, cord and power switch.

Good luck and have fun. Let me know if you need more information.

Since others are posting their opinions on receivers here, I'll throw in my vote.

I had a chance to try out a ICR70 a few weeks ago for about an hour and it is truely a fine rcvr. If bucks were no problem I would go for one without doubt.

My main "auxilliary" receiver is a Kenwood R-1000. For the money it also is a fine rcvr. In this area there are more hams with that rcvr than any other. All I have encountered have excellent stability and minimum drift (about the same as my 820S transceiver).

When using a random wire for an antenna, it is a good idea to use a small antenna tuner for best results, as one really should with any rcvr.

A tuner is a must when using it below the broadcast band to prevent

bdcst stations from creeping in. I am about 20 miles from several
50kw stations.

As I pointed out in my article in "73" magazine a year or so ago,
The AGC time constant is reversed from what it should be (unless
Kenwood has corrected it by now). On SSB/CW it has the fast AGC
and on AM it has slow release AGC, which is backwards.

My R-1000 is used mainly for rtty work and is quite adequate for this.
Rtty probably requires a more stable rcvr than any other mode.

I have transmitted on nearby frequencies (working splits on the same band)
with a separate antenna on the R-1000 and have not blown the front end
out as has happened to other rcvrs and transceivers.

I would stay away from the R-600 and the R-2000.....

The only R-600 I have had access to had a mechanical problem
in the VFO dial mechanism -- backlash!

The R-2000 steps in 50 Hz jumps when tuning. This is especially
bad for RTTY use. Beyond that, I can't comment as I have not
actually used one.

Another fairly decent rcvr is the Yeasu FRG-7. This is an
older rcvr of theirs but is synthesized and very stable.
They can be had for less than $200 used. I use one for a
backup rcvr and for semi-continuous monitoring of a particular
frequency, while tuning around with the other rcvr.

The FRG-7 does not have digital readout, although there are some
available as add-ons. The Analog dial can be read out to within
a couple of kHz with care.

The IF filter is a little wide but can be replaced. The product
detector is quite good. This rcvr is more forgiving on what you
use for an antenna since it has a tunable preselector.
It also can be powered from internal D cells or external 12 volts,
making it ideal to haul around on vacation.

Stay away from the Radio Shack jobs. Bad dial mechanisms and
lotsa drift are their main problems.....

A very important thing to remember if you're going to build your own EPROM
eraser is that short wave UV is very harmful to your eyes. Commercial units
are well enclosed and have interlocks to keep you from blinding yourself.
Be careful!

Phil

I am looking for a transceiver that has: 1) general coverage,
2) digital display, 3)multiple VFO capability. My previous
experience was with a TS 520 with narrow CW filters and a VFO.
I used the VOX for "semi-break-in" capability (it dropped out
of XMIT between words). I don't know the precise definition of
full QSK, maybe if I did I'd want that, too.
    Does any one have something NICE or NASTY to say about any
transceivers that would be appropriate? Please post it or UNIX
mail it to iddic!brucec. TNX.

The easiest way to find the "public" frequencies - towers, IFR control centres, etc., is to use the same publications the pilots use. In Canada, you'd want something called the VFR and IFR supplements - they list all air traffic frequencies needed by pilots. There must be corresponding FAA publications. Find a nearby pilot (or flying club) and ask.

It is with great pleasure that I pass along the news I learned last nite. At the recent annual meeting of NZART, the New Zealand national society, Ian Ashley, ZL1AOX was presented a certificate of merit naming him as Amateur of the Year for 1983 for his work as an AO-10 telecommand station and for his pioneering work in packet radio.

I know I express the congratulations of all the AMSAT membership to Ian for this most deserved award.

#N:trsvax:52800019:000:955
trsvax!mikey   Jun 8 09:18:00 1984

I'm about to design a RTTY card for my Coco. I'm having no trouble
designing it for 170 hz shift. However, I want to make it so that
it will also function on 425 and 850 hz shifts that I've heard are
used commercially in the HF bands. I'm using an Exar 2211 as the
demodulator. Since the 2211 can be tailored for different data
rates and such, I need to know what speeds are used. I'm new to
RTTY and the only thing I know is that hams on VHF generally use 110
baud in the Dallas/Ft. Worth area with 170 hz shift.

I was also going to use overlaping switched capacitor filters to give
me a variable bandwidth filter, but I don't know if the filter is
even necesary on VHF. If it isn't, it will be added later, as my primary
goal is to get up a monitor on VHF first, then get transmitting
ability on VHF, and then start on the other bands. I don't know what is
necessary at this stage of the game. Any suggestions?

mikey at trsvax KA5MJQ

++++++++++++++++++++++++++++++++++++
With respect to the R600 anti-recommendation posted:

I've been using one for over a year and have been quite pleased with it.
The review in the 1983 World Radio TV handbook reinforces this view.
It is sort of the current VW of communications receivers.

Best prices for it seem to consistently be from The Ham Radio Outlet
stores--see their ads in CQ or 73. (about $280.)

Although I have read reports of problems with backlash in the dial
mechanism with some R600's, I have no appreciable backlash on my
receiver--Perhaps it is a good idea to try before you buy--or
at least ask the dealer about it beforehand.

To: All packet stations
From: Hank Magnuski, KA6M
Subject: Packet activity in W. Germany

At approximately 0700 UTC on June 7th, 1984 a new packet station
in Munich, DL3MAO, "Bernie" reported copying packets from Wes, K7PYK,
in Arizona on the Oscar 10 digital channel.

Bernie reports that there are four TAPR boards on the air in the
Munich area, and another four in the Hannover area. He also has learned
that there is now an active group in Switzerland, near Zurich.

In response to the question:

> "...Does any one have something NICE or NASTY to say about any
> transceivers that would be appropriate? Please post it or UNIX
> mail it to iddic!brucec. TNX."

The Indian Hill Amateur Radio Club here at AT&T Bell Laboratories has Kenwood's top of the line TS-930S general coverage transceiver, and an older pair of Drake R4B/T4XB twins.

The general coverage and digital features on the Kenwood are neat, but it lacks:

1. scanning of memory channels

2. provision for FM detector

3. memorizing of mode along with frequency

4. all-mode squelch control

Leaving aside all the nice digital control circuitry, the Kenwood is "left in the dust" by the older R4B when trying to copy a signal in the presence of other strong signals (e.g. Field Day). There is an odd asymmetry in the type of controls available for use in CW and SSB. As an example, the dual variable bandwidth control functions in SSB but not CW mode.

Last Friday (June 1) I bought a ICOM IC-R71A for $700. I have only played with it for a few days (this being Monday), so I haven't really put it through its paces. My previous receiver was a Sony ICF-2001, which is helplessly out-classed by the ICOM. I'll post a follow up review later.

My primary interest is in Medium Wave DXing. I saw wonderful reviews of the R70 which said that it was superb for BCB work. I also saw the reports of poor quality control which caused some R70's to die, as well as hearing that they were extremely succeptable to static build-up which would fry the front end. So, I waited.

When my eyes caught the first R71A add, I fell into immediate, and deep love. I had to have it. Then I read a six or seven page review of the R71A by a Australian DX club in DX News (the publication of the National Radio Club) which was quite detailed and pointed out the good and the bad of the radio. All in all, it fixes most (but not all) of the R70's quirks. More importantly the review stated that in their opinion this was the best performance for the money that could be had in the $500 to $3000 prrice range. I was sold, and I waited until my wallet caught up.

It is a fantastic receiver. I find it very enjoyable to operate, and I have been having so much fun with the shortwave spectrum that I haven't really gotten down into the BCB too often, though when I did I caught a few new stations where I had previously heard static. This receiver works very well in ECSS mode, which then provides full access to the PBT and notch. Also, the noise blanker works extremely well at getting rid of ac line hash, which made low frequency (100-500KHz) work almost impossible before.

If you can stand the wait, save up and buy this radio. More later.

I think he wants the commercial frequencies used by the particular
airlines not the ATC and UNICOM frequencies listed in the AOPA books.

Here are a few of the many O'Hare Airport (Chicago) airlines frequencies:

```
f  460.775  KDM873   American Airlines
f  462.700  KAC8703  American Airlines
o  462.575  KAB7781  Britt Airlines (Chicago)
p  460.825  KSI674   Delta Airlines (Chicago)
p  460.825  KVT401   Delta Airlines, portables (USA-wide)
f  464.875  KTY716   El Al Israel Airlines (Chicago)
p  460.875  ?        Midway Airlines (Chicago)
o  464.525  KZZ826   Ozark Airlines
p  460.675  KTT668   Trans World Airlines (Chicago)
p  461.750  KBR316   Trans World Airlines (Chicago)
```

  o = somebody has confirmed usage of this freq
  f = as listed in FCC records/not yet reported as being used
  p = as listed in press /not yet reported as being used

The converter is only about 4x4x1". It can tune *parts* of the 19, 25, 31 and 49 meter bands. There is a button on the front for each band, and they are ganged to the on/off-bypas switch. There is an LED on/off indicator.

There's good news and bad news, mostly good. It does a very good job converting for my car radio (an AM/FM Ford OEM). It down converts on a 1:1 ratio to the tuning strip. Shortwave comes in between approx 800 and 1200 Khz, giving a 400Khz slice of each band:
19m 15075:15475- 25m 11638:12038- 31m 9438:9838 and 49m 5875:6275.
Reception is about on par with a $100 portable, BUT with a much better bandspread. Heavyweights (RCI, BBC, DW, etc.) come in with hardly noticable interference. If a station is down in the dirt, it's lost. Nighttime reception is great, daytime poor. Suprisingly, there is hardly any fade.

Now for the BAD news...1) It cuts heavily down on regular AM reception (I

know, I know, I should thank heaven...). FM sensitivity is left unchanged. 2) My car electrical system causes so much RFI, that I might have to license it. I can quiet the ignition system, but weaker stns get wiped by, say, the windshield wiper motors. 3) The 'mounting hdwr' supplied was a joke. A trip to Radio Shack was necessary.

All in all the MFJ allows me to fulfill a childhood wish of DXing in the car, and gives me something to twiddle with in traffic. It's worth the $80.

MFJ 1020 Active (Indoor) Antenna

The MFJ 1020 Active Antenna consists of a telescoping antenna and a preselector-type circuit inside the now familiar beige and wood grain cabinet. The frequency coverage of approximately 200 KHz to 30 MHz is divided into 5 bands.

A small, external power supply is required, but not provided.

The 1020 lists for $80 new, but I purchased it at a hamfest for $20, and performed one minor repair (replaced a fiber washer at the base of the telescoping antenna). I use this unit with an ICOM R-70 general coverage receiver. Overall, the MFJ 1020 works better than expected, although still not as good as an outdoor antenna.

The Bad News

Phono jacks are used rather than the SO-239 type.

The inclusion of an LED indicator lamp in the 1020 really precludes the prolonged use of any internal battery.

One problem with my particular unit is that, despite the dial markings, coverage ends at about 28.5 MHz (rather than 30.0 MHz). There is no simple trimmer capacitor that can be adjusted as a remedy. One of these days (yawn), I'll have to trim an inductor.

Active antennas are more prone to electrical interference. A photoelectric night light in an adjacent room causes a high QRN level, due to the SCR in the dimming circuit, and must be disabled during listening periods. Emissions from the horizontal oscillators of TV sets in the building also cause problems.

Use of a narrow band (tuneable, in this case) antenna makes "instant QSY" impossible. One cannot make full use of the broadband capabilities of the new generation of general coverage receivers. This is a shame, especially if one has a receiver such as the ICOM R-71 or the Kenwood R2000 which contain several memories.

The Good News

The MFJ 1020 works! The bypass switch on the front panel allows quick in/out comparisons.

The 1020 has a jack on the rear for another antenna. (This jack is always connected to the telescoping antenna.) I use a 30 foot piece of wire connected to this jack, and dressed internally around a window frame. In this setup, the 1020 is used essentially as a super preselector, and it permits me to hear many more stations than using the telescoping antenna provided.

Using the 1020 and some wire indoors allows one a fair level of SWL'ing.

Closing Comments

If you are in a condo/apartment situation, I recommend buying an MFJ 1020 at a hamfest or a sale. Like many MFJ products, it looks good on the outside, but you may feel guilty if you've paid the $80 list price after looking at the simplicity inside.

I have a Yaesu FT757-GX and I think it is terrific.

It has general coverage receive, dual vfo's, full breakin (QSK), eight memories,
USB, LSB, CW wide, CW narrow, AM, FM; modes all as standard features.
I have noticed that Kenwood and Icom are lowering the prices of the 430S and
the 745, obviously to compete better with the 757, but they still cost more
and do not have the narrow CW filter, FM and AM (430S) built in.

Just in case anyone thinks that I am total biased against Icom and Kenwood,
if you do not want general coverage receive capability, then I think that
the Icom 730 is an execellent transceiver for pure ham band work.

qst de k9eui
hr propagation bulletin nr 24 from arrl headquarters newington ct
june 11 1984 to all radio amateurs bt

from early january through late may, the sun was more active than would have been expected so late in the solar cycle, but it lost most of its spots in the last two weeks. the solar flux was 66 points lower on may 27 than on april 29, one solar rotation earlier, and down to 90 on june 10. this was its lowest level since january 10.

the best part of this picture is that the effekts of lower solar flux and lower sunspot numbers are minimal at this season. if the sun should recover somewhat in the autumn, it will do more for northern hemisphere dx then than now. more on this prospect will be given in late summer bulletins.

a portion of the sun with that flux peak of 140 on may 21 will come into view about june 14. for the week, it is expected that hf propagation will be fair to good june 11 to 13, but recurrent geomagnetic disturbances are due june 16 through 21.

sporadic e layer ionization increases gradually in june, helping to keep things happening on 21, 28, 50 and possibly 144 mhz almost regardless of flux or sunspot numbers.

american sunspot numbers for may 31 through june 6 were between 24 and 48 with a mean of 37.3. ar

If it cut down the AM sensitivity, retune the car radio. There should be some external adjustment labeled "ant tune". It may be internal to the radio and more trouble than it's worth, especially if you don't care about AM that much. However, you may want to retune it for maximum reception of the shortwave to increase sensitivity.

Any one interested in going to the national convention in NYC this July by bus can reserve a seat or obtain further info by writing:

Garden State Amateur Radio Assoc.

P.O. Box 74
Allenhurst, N.J. 07711

The cost is $10 for just the convention, $36 for the convention and banquet. When you consider tolls, gas, the admission price, and cost of parking (if you can find a space on convention weekend) it's not a bad deal. The trip is on the day of the banquet, which is Saturday July 21. Both buses depart at 0830 from Boro Bus Terminal, near the intersection of Sycamore and Newman Springs Rd. in Red Bank. The convention only bus leaves NYC at 1630; the banquet bus about 2300. Please put call and tel. no. on check and make payable to Garden State Amateur Radio Assoc. Remember, national conventions don't occur all that often, and it will be a long, long time before another one is in the NYC area again. Hurry, time is short.

[pre-Rockwell]

I'm looking for the late generation manuals (and there publication numbers)
for the R389/R390(A)/R391. I have the 1970 USN Technical Manual (NAVSHIPS
0967-063-2010) for the R390A with update T-1 through T-4 (Nov 1974).
The Air Force versions are preferred. How about the commercial printings ?

I am also looking to acquire an R389 and an R391; Have one for sale or
TRADE or know of someone that wants to get rid of one ?

Also looking for spares for the R389/R390(A)/R391.

I have a lot of 'stuff' that I can trade/barter.

I'm now working on FET substitution mods for the R390A, if interested I'll
do a write up and post it. The PTO (VFO) is being worked on now.

If the R390A mods workout, I'll do the SP600-JX next.

pppppppp

Can anyone give me info, based on experience or otherwise, concerning
the B&W folded dipole model 370-15? How well does it perform, both
receiving and transmitting?

Please mail replies to:

Dave McLin at NCSU

( dm @ decvax!mcnc!ncsu)

Thanks

From: Richard Shapiro <RSHAPIRO@BBNA.ARPA>

Now that we've seen a review of the MFJ-1020, is anyone prepared to
offer reviews of some other active antennas? In particular I'm
wondering about the Dymek DA-100D and the Sony AN-1 (particularly
for apartment use). How about tuners for wire antennas?
Comparisons/contrasts appreciated.

Thanks,
richard shapiro/bbn cambridge,mass

I am considering building an antenna composed of four (4) Ringo Ranger II
antennas (Cushcraft ARX-450B). The antennas would be mounted one above the
other, with the second and fourth (from the top) inverted (phased

appropriately), and (looking from the top down) at 90 deg. angles on a
1 1/4" mast. The justification for doing this is that the performance should
rival that of the commercial collinear antennas at a fraction of the cost.
If you have made such a thing I would like to hear your comments. TNX

A local Portland company has surplus electrical parts
for sale (in bulk). The parts are basically components
for answering machines and include:

- motors
- stuffed circuit boards
- small speakers
- small tape drives
- wire
- wire harnesses
- screws, nuts, bolts
- misc phone handsets

and the like.

If you are interested in buying a large quantity of parts,
or know of a local organization which can benefit from
a donation, please respond to :

MY EXPERENCE WITH RINGO RANGERS, EVEN THE LATEST VERSIONS, IS THAT ONE
RINGO RANGER HAS A GAIN OF 3DB.

OVER A DUMMY LOAD!! THAT IS.

Though claims that the RINGO has 3dB gain over a dummy load are amusing,
I was hoping for serious (showing or characterized by deep thought) replys.
Indeed if this is a serious reply then you need to have someone help you
tune (or even assemble) the RINGO before you measure its radiation pattern.

From: "Dale M. McNulty" <MCNULTY%UCI-20A@UCI-750a>

What kind of performance do you expect to get out of this stack?
>From personal experience I can tell you that a Hustler G6 or G7
outperforms the single RINGO hands down. I can't quantify the
difference, but I can tell you that side by side tests have

sent a number of people away shaking their heads. Of course, these are both end-fed units and I suggest you try center-fed if you really want to see a difference. I regularly use a center-fed which is only seven feet high because the end-fed units are ten to seventeen feet long. My apartment manager objects to seventeen foot 'decorations'. I find the performance almost identical. If I put the center-fed up as high as the Hustler, the center-fed is noticeably better and occupies less space. Austin has a center-fed which is composed of two arms which can be swung up, down, and sideways. This has some potential for switching between vertical and horizontal polarization (maybe even both simultaneously). I ordered one this week.

Someone asked about handhelds. I can't find time to read and respond as often as I would like so here are my belated comments. I own a Yaesu 208R. I really like it. It is tough as nails. I was talking to someone yesterday who drove off down the freeway with his 208 on top of his car. 208's don't come with mag mounts so it slid off at about 50mph. It bounced a great distance. The case is badly torn up. Even the battery case was ground down by all the sliding. Well, the 208 "took a licking, and kept on ticking". When I talked to him he was pushing buttons with an eraser but he still sounded great. The shops tell me it is the most reliable unit they (don't) see. I suggest the NC-8 Power Supply and Charger. For two years I operated base with this rig and I'm still using the same battery. I just did buy a 708R to see what the 450 band is like. Anybody have any comments about 450?

I would strongly recommend NOT using the UHF Ringo Ranger!!!!!

I have one up at home, fed with 1/2 inch hard-line and it fails to
work under certain conditions of moisture. The SWR is ridiculously
high especially in fog. I intend to replace it as soon as I determine
what I want to replace it with.

How about building a collinear using coax sections (that's what
Andrew and Phelps-Dodge do)? Use pvc to house the antenna.

Bob K9EUI (WA9AAC/R)

I'm looking to buy a scanner.  Can anyone out there give
me any information?  For example, what do people on the
net own?
    I guess the choice is either Bearcat or Regency.  I'm
thinking of spending about $200.  I can buy the Bearcat
210XL for that price.  The only thing that disturbs me
is that most scanners at that price don't have the
```

118-136 aero band. Is this not a popular band?
    Anyway, please send or post any info. Thanks!

qst de k9eui
hr arrl bulletin nr 47 from arrl headquarters
newington ct june 15, 1984
to all radio amateurs bt

the fcc has denied the arrl petition for rulemaking, rm 4040.
the league had requested that cable tv operations be prohibited
on amateur frequencies, but the fcc felt that this was too
drastic an action. however, it is not a total loss for amateur
radio. in denying the leagues request, the fcc used strong
language to remind the cable tv companies of their
responsibilities not to leak excessively and to eliminate
harmful interference even if leakage is within fcc limits.
details will appear in the arrl letter and qst ar

qst de k9eui
hr propagation forecast bulletin nr 25 from arrl headquarters
newington ct june 18, 1984
to all radio amateurs bt

after several days of solar flux levels in the low 90s, solar activity began to rise on june 13. by the 15th, the flux was up to 114. the indications are for gradually lower readings during the forecast week and through the end of june. the level of geomagnetic activity is no (garbled copy here) in

propagation factor at this season, especially in our northern states and adjacent areas. on this basis, fair to poor propagation is predicted through june 20, improving to fair to good through the 28th. the early part of the arrl fd weekend should have good summer conditions on our lower frequencies in areas not plagued by thunderstorms. the usefulness of ??? 28 and 50 mhz will depend to a large extent on sporadic e layer ionization which peaks in late june. short skip, often with high signal levels, can break out suddenly, so field day teams keep continuous watches on these bands, especially 28 and 50 mhz. e skip is most common in late morning and early evening hours, local time, but it can show up at any hour. stable, calm weather makes for above average signal levels and extended range on 50 mhz and higher frequencies.

american sunspot numbers for june 7 through 13 were between 22 and 45 with a mean of 30.9 ar

PETER...

I ALSO HAVE A 757. MINE IS AT YAESU FOR REPAIR AFTER A 61ST DAY FAILURE.
I ATTENDED THE HAMCOM CONVENTION HERE IN DALLAS RECENTLY ES THE YAESU
BOOTH WAS ATTACKED BY ANGRY HAMS COMPLAINING ABOUT THEIR 757'S. IT SEEMS
THAT MANY OF THE 757'S WIL OSCILLATE WHEN OPPERATING 10 ES 15 METERS. BE
SURE AND CHECK YOURS FOR THIS. SOME OF THE PEOPLE WERE ALSO SAYING THE
FM DIDN'T WORK. TOWARDS THE
END OF THE CONVENTION, THE YAESU PEOPLE WERE GETTING VERY FRUSTRATED
WHEN ANYBODY EVEN MENTIONED THE 757. I STILL THINK IT HAS THE POTENTIAL
OF BEING A VERY GOOD RIG BUT THEY ARE QUITE OBVIOUSLY HAVING SOME
PROBLEMS WITH IT. ANY WAY, I HAVE BEEN ASSURED BY THE YAESU SERVICE
MANAGER THAT MINE WIL RETURNED WITH THE LATEST UPDATES WHICH IS
REASSURING. YAESU CLAIMS THESE RADIOS ARE PUT TOGETHER BY
ROBOTICS....PERHAPS MY RADIO WAS ASSEMBLED BY A ROBOT WITH A SAKE
HANGOVER??

For those of us who bought the MFJ-1224 RTTY/CW modem at Dayton, there seems to be a possible problem with the first RTTY program on the cassette. Mine wouldn't work and neither did the CW program.

I called the MFJ technician (601/323-5869) to check out the problem. He confirmed the following cable connections for the "C64": RTTY(demod) pins L,B,C   GND pin N   CWID pin H RTTY pins J,M CW KEY pin K.

The CW program does not work unless you jumper RTTY(demod) to CW(demod). The RTTY may have a problem and is being re-written and will send a new copy to those who request it. """NOTE""" THERE ARE "2" RTTY AND "2" CW PROGRAMS ON EACH SIDE OF THE CASSETTE. TRY THE SECOND RTTY PROGRAM AND IT SHOULD WORK.

I have not tested these fixes but if any of you are as frustrated as I was when I couldn't get it to work may want to try this info as it may be a while befor I can.

I have recently acquired a nice short-wave radio, but I don't know what
I am getting. Where can I get a listing of the frequencies that the big
broadcasters (ie BBC, Voice of America, Radio Moscow, etc.) use. Also,
is there any info available about scheduled program times for these
broadcasters? I am interested in finding specific programming (for example,
the sports reports on BBC), but don't want to use trial and error.
In advance, thanks for any help given.

hr propagation forecast bulletin nr 19 from arrl headquarters

newington ct may 7, 1984

to all radio amateurs bt

as predicted last week, the solar flux went into a steep decline, from 183 on april 29 to 106 on may 6. the large and varied active spot groups responsible for the years highest flux level have now disappeared around the west limb. some new activity is showing in the east but so far it has merely slowed the rate of decline. some upward movement is expected around the middle of the forecast week.

the barrage of solar flares continues, and with this have come more almost total ionospheric blackouts and auroral effects in the northern states and adjacent areas of canada. propagation conditions will continue very variable much of the time, but with improving signal levels and reduced fading late in the forecast week. some increase in the number and duration of e skip openings on 28 and 50 mhz will be noticed, and some e skip may appear briefly on 144 mhz, although major openings on this frequency are unlikely until late may or early june.

american sunspot numbers for april 26 through may 2 were between 82 and 123 with a mean of 101.7 ar

If you are after a book on cryptology, I do not recommend this one.
Kahn's book "The Codebreakers" was a great book, however "Kahn on
Codes" is a waste of time and money. It is mainly a collection of
various papers previously presented elsewhere and does not offer
anything new or different.

The arrl did not have a dx bulletin available again this week!

For those interested in listening to programming on shortwave,
the BEST source for info, including extensive reprints from the BBC's
program magazine, London Calling [which has to be ordered direct
from Britain with all the hassle of getting an international draft
or money order] is a subscription to the privately-published magazine
REVIEW OF INTERNATIONAL BROADCASTING. [Address: PO Box 6287, Knoxville,
TN 37914] A sample copy is $1.50, subscriptions $18.00 for 12 issues.

This is published by a well-known DXer and SWL, Glenn Hauser (he does
the DX News segments for Radio Canada International's SWL Digest program,
and has a radio show called "World of Radio", aired on some FM stations
and on WRNO shortwave -- best time is 0430 GMT Saturdays on 6185 kHz --
that's Friday night 2330 CDT). The magazine was created to fill a void
in the DX/SWL community for something oriented toward program listeners,
as opposed to DXers who just log stations and care little about program
content, though it does have DX info (new and rare station data, etc.).

The magazine has periodic listings of "Broadcasts in English", either
by country of origin or by time & frequency, usually each seasonal
change period, when the broadcasters shift frequency. These are more
current and accurate than the listings in Popular Communications,

because this isn't a slick magazine with 3-month-minimum leadtime.
Glenn gets the data updated at the last minute and keeps it current
with followup updates in succeeding issues.

The magazine is much like a print version of a network digest, with
reader contributions forming the majority of the contents. There
are listings by country of discussions and program info of various
broadcasters, articles on stations or personalities, and equipment
reviews and discussions on modifications or technical details of
receivers, antennas, and accessories.

Everybody with a general-coverage receiver should have a subscription
to RIB; it's the handiest and most worthwhile adjunct to SWLing
available. Membership in one or more DX clubs can be quite worthwhile
in addition to RIB, but no club has the depth of program info RIB has.

Will Martin

PS - I hope I got the zip right above; I'm doing this from memory.
If I made an error, I'll send in a follow-up after checking at home. WM

If you want to know what programs are coming up on the BBC World service,
you need 'London Calling', a monthly put out by the BBC. Its about 16 pages
of program info and articles plus a frequency-time transmission plan.

It costs UK Pounds 8 i think, - around $12 a year for air mail.

Most other large national services put out some kind of a flyer for free
- just write to BBC, London England, or Radio Moscow, Moscow, You Know Where
it's amazing how the postman knows where to deliver it.

There seems to be some hang-up somewhere on the chain between the net.ham-radio newsgroup on USENET and the ARPA mailing list INFO-HAMS@SIMTEL20. For example, I submitted this response to the ICOM R71 inquiry several weeks ago from my SIMTEL20 account to the Info-Hams list, but I never saw it appear on net.ham-radio here at brl-vgr, where I read USENET newsgroups. In case it never got promulgated over net.ham-radio, I am resubmitting it as a newsgroup posting.

This receiver has been reviewed and discussed in the SWL press and on the DX programs of major shortwave broadcasters, like Radio Nederland's "Media Network" and Radio Canada International's "SWL Digest". The general consensus has been that it, like the preceeding R70, is a great receiver for the money, but that ICOM came out with this new model with a great flurry of bells & whistles, but left out basic features like an RIT, which will impact RTTY use.

Most of the problems reported with the R70 came from Europe, where there were a number of models with VERY poor performance -- seemed to be a quality control problem. I had put out an inquiry about this on USENET's net.ham-radio some months ago, asking if ICOM had shown similiar model-to-model quality variations on other products, but saw no replies or comments. (As an SWL, I see those ham products that are receiver-oriented, and the R70 was about the first ICOM product that got wide coverage in the SWL press, so I was not aware of much data on the preceeding ICOM product range, like their 2m gear.)

For those who are interested in the computer-controlled features of the R71A, a warning -- all the ads and reviews I have seen have MENTIONED the computer-interface unit, along with the voice frequency readout and other accessories, but NOBODY has yet seen them, used them, or PRICED them! This usually means a "paper product" -- not yet built. I wouldn't count on one being available any time soon.

A Swiss firm had announced a multi-channel memory unit for the R70, which I believe had some computer-controlled capabilities. I don't know if it became a viable product; ICOM announced the R71, with its built-in memories, just after that item had some publicity, which probably killed it off by pulling the rug out from under its market. (What a mix of metaphors!) However, it also was designed to work on at least one other popular model of shortwave receiver, so it might still be viable. Haven't seen any ads in the last few months, though.

Has anybody seen any closeout bargain deals on ICOM R70's since the R71 was announced? Best price I had seen for the R70 was $574; surely somebody is dumping the remaining stock for less, unless they are

all gone by now...

Will Martin

I am new to the hobby, and am wondering if there is an organized way of relaying messages on the 2 meter band. I will be driving a van full of scouts to New Mexico, and am curious whether I could use a 2 meter handheld transceiver as back-up communications to allow parents in the Berkeley, Ca. area to get hold of us in an emergency. Is there a number that the parents could call to get the name of an operator willing and close enough geographically to contact us? Thanks in advance,

Allen Takahashi, N6KDM

No one has yet mentioned The World Radio and TV Handbook (WRTH). A yearly
compendium of broadcast station info, the WRTH is probably the best
you can own. It contains all freq listings, service HQ addresses and even
,for those who can read music, a few bars that help identify interval signals.
The WRTH is available in bookstores, hamfests and some electronics stores.
Can be mail ordered from Gilfer.

Would there be an interest in SWL sufficient to try to start a net newsgroup?
Send me an indication if this tickles anybodies fancy.

    Is there anyone out there who is using the MFJ-1224 RTTY
    modem and the Dayton Hamfest give-a-way software?? If so
    does it work with the C64??? I can not get the RTTY receive
    to work. Also the CW program receive does not work. MFJ
    assures me that the RTTY program is good but the CW has a
    bug. I get no printed characters on the screen. The MFJ
    1224 works fine with the Kantronix and Atari software and
    computer. I am wondering if it is my C64 if so I have a
    short time left on warranty and need to know what to do next.
    I would greatly appreciate any info you can give me.

I just received over 24,000 pages of unclassified federal
government frequency listings (on 80 microfiche cards).

The lowest frequency listed is:

     9.375 KHz USN Fairbanks Alaska (Experimental) emission=.10A1 power=   200w
     9.375 KHz USN Sentinel Ariz   (Experimental) emission=.10A1 power=
     70w
       10.200 KHz USCG Haiku Hawaii (radionav)   emission=.10A9 power= 20000w

The highest frequency listed is:

       863.500 THz Army Wsmr NM   (Experimental) emission=10.00P0
     power=20000w

THz means terrahertz!

[ARRL]
Advanced SWL, (may even get my lic back some day) 1.6-30Mhz, remote
control (computer), all internal sigs should be accessible, at least
the IF (Have Panadapter, home brew digital FAX, etc.)

It is time to retire to standby my National HRO-500. Any suggestions out
there ? I have heard some bad news on the Icom R-71(A?), and I saw someone
post on the net (usenet) that there has been news on another net not getting
gated to usenet, true ? The ICOM would be at the bottom of my list, I have
had access to a Harris 550 from time to time, nice. Now that it is no
longer in production has anyone seen one on the market ?

On the Icom R-71; what is this I here about remote/computer access ?, is it
true, is it really there, I called ICOM and they just read me the glossies,
I can do that. I asked about a service manual, the best I could get is that
the preliminary version (English, I hope), might be here sometime in
NOVEMBER !!@#*@)!! (didn't ask if that was 1984).

What filters are there for the ICOM ?

Regarding packet radio and TAPR: The TAPR TNC (and others) can be used
on any frequency, subject to bandwidth and signalling speed limits.
The TAPR board can go as slow as 50 bits/sec, although it is normally
run at 1200 bps over VHF FM transceivers. It has an on-board modem
equivalent to the Bell 202, but it can be easily bypassed to use an
external modem (such as an RTTY TU). The protocol might be a bit
bulky at slow speeds on HF channels so you might want to try AMTOR
instead, but AX.25 is a much more modern protocol and is clearly the
way to go for serious networking.

UoSAT-Oscar-11 was successfully commanded on for the first time in
over two months this morning from Surrey. It was heard from KA9Q
on the first pass this morning on 145.825 with very good signals.
Initial analysis of telemetry shows everything to be in pretty good
condition!

An item of interest to all shortwave listeners, from this weekend's
Radio Canada International's SWL Digest program:

A free sample issue of the new "International Shortwave Listener's
Program Guide" periodical is being made available on request for the
cost of postage. US residents send 37 cents in coin (Canadians send
70 cents in [I suppose] Canadian coin, overseas send 7 IRC's) to:

Larry Miller
Miller Publishing
424 W. Jefferson St.
Media, PA 19063 USA

Along with your name & address, so they know where to send it.

(I don't know why they want coins instead of stamps from US respondents,
but I sent them the coins as requested.)

> to coordinate the Olympic Torch Relay?

To answer my own question, they're using a series of local
repeaters along the route. The torch came through New Jersey
Saturday, and the amateur radio part of the operation was
first class.

Here are the first two frames that were received solid at KA9Q this
morning from UO-11, followed by decoded versions. I've got
tons more of this stuff if anybody wants it.

For those of you using my C-language telemetry decoding program for
UO-11, I've discovered two minor bugs:

Change the line which reads
     if(sscanf(cp,"UOSAT-2%2d%2d%2d%1d%2d%2d%2d",&year,&month,&day,
to
     if(sscanf(cp,"\036UOSAT-2%2d%2d%2d%1d%2d%2d%2d",&year,&month,&day,

Since I had never received telemtry direct before, I didn't know about
the leading "funny character" which the various electronic mail systems
had stripped off.

Also change the line which reads
     n = sscanf(cp,"%1d%1d%1d%1d%1d%1x",&chan1,&chan0,&n2,&n1,&n0,&chk);
to
     n = sscanf(cp,"%1d%1d%1x%1x%1x%1x",&chan1,&chan0,&n2,&n1,&n0,&chk);

I didn't notice that hex digits were valid in the status bit channels
of the telemetry (those greater than 60.)  In particular, this kept channels
61 and 66 from decoding.
```

TO TMAIL MSWEETING,AMSAT
FROM L. S. Kayser, WA3ZIA
UO11 finally heard in Ottawa!!!!!
at 1425 to 1436 Z this date UO11 was copied by VE3BNO in Ottawa.
Congratulations all, we will start now collecting Telem
regularly. It has been worth the wait!
Surrey note please PRIME link wont be bsck until I return to work
around june 1.

Regards, Larry

From: MSWEETING
To: AMSAT
Subj: Oscar-11

The following report was circulated within the G.B; it is the only output we are likely to generate for a few hours. The telemetry received so far appears very good.

Following persistent commanding from the Guildford command station, the University of Surrey's second spacecraft, UoSAT-Oscar-11 (UoSAT-2) is now transmitting telemetry data after weeks of silence.

Over the weekend of 11th to 13th May, dedicated radio amateurs at Stanford Research International in California and their outpost in Greenland heard very weak signals emanating from the satellite command RECEIVERS which, by their nature of operation, generate small signals on a frequency near to that which they normally listen. These signals told the University satellite team that their craft was still alive, although at this time the chances of complete recovery were not known. Although this observation, the first one confirmed since launch, did not lead directly to recovering the satellite, it did confirm that the orbital predictions provided by the NASA tracking organisations were correct and that the object being tracked by the Surrey team was indeed UoSAT-2.

This morning (14th May) at 10:24 GMT, with Dr. Martin Sweeting (UoSAT project manager) abroad on holiday, Neville Bean and Roger Peel, full time satellite researchers in the Department of Electronic and Electrical Engineering continued to command the satellite using its 144MHz uplink, to no effect. At 11:01GMT (12:01 BST), Neville made further command attempts on 438MHz, and after a brief stream of initialisation commands, the main UoSAT-2 beacon (145.825MHz) was powered up at 11:05.

The signals from the spacecraft were as strong as the last ones heard from it on the 1st March, when it stopped transmitting shortly after launch. Telemetry data, from the initial two orbital passes over Guildford, appears to be very encouraging, with temperatures around -5 to 0 degrees centigrade, as expected, and a battery voltage of 14.6 volts. The spacecraft is still spinning, but this will have stabilised since the previous data received immediately after launch, ready for attitude control manoeuvres. These will not start until after the causes of the 11 week silence have been investigated, a process that itself may take many weeks in order to exercise the caution necessary in this situation.

The UoSAT-2 spacecraft will be transmitting telemetry data continuously for the next few days while initial checks are made on the telecommand system, but after this other data formats will be generated using the spacecraft computer to check further the spacecraft's health.

Initially, the University of Surrey is encouraging radio amateurs and schools used to collecting data from UoSAT-1 to send them all the telemetry they receive from UoSAT-2, so that the picture of its current state can be generated as soon as possible. The AMSAT series of amateur-radio oriented satellites benefit greatly from the thousands of receiving stations around the world who are able to send such data back to the controlling organisation.

First UO-11 Telem Frames at KA9Q
Here are the first two frames that were solidly recieved at KA9Q
on the first pass this morning. A decoded version of these same
frames is on the 'eng' bb. I've got tons more of this stuff.
Enjoy!
Phil

Decoded UO-11 Frames

The program echoes each raw format line, then follows it with the
interpretation. Note that the clock was running, but it had not
been intialized.
73, Phil

C-language UO-11 decoder fix
For those of you using my C-language telemetry decoding program for
UO-11, I've discovered two minor bugs:

Change the line which reads
     if(sscanf(cp,"UOSAT-2%2d%2d%2d%1d%2d%2d%2d",&year,&month,&day,
to
     if(sscanf(cp,"\036UOSAT-2%2d%2d%2d%1d%2d%2d%2d",&year,&month,&day,

Since I had never received telemtry direct before, I didn't know about
the leading "funny character" which the various electronic mail systems
had stripped off.

Also change the line which reads
     n = sscanf(cp,"%1d%1d%1d%1d%1d%1x",&chan1,&chan0,&n2,&n1,&n0,&chk);
to
     n = sscanf(cp,"%1d%1d%1x%1x%1x%1x",&chan1,&chan0,&n2,&n1,&n0,&chk);

I didn't notice that hex digits were valid in the status bit channels
of the telemetry (those greater than 60.)  In particular, this kept channels
61 and 66 from decoding.

73, Phil
.

Subj: Oscar-11

  The following report was circulated within the G.B; it is

the only output we are likely to generate for a few hours. The telemetry received so far appears very good.

Following persistent commanding from the Guildford command station, the University of Surrey's second spacecraft, UoSAT-Oscar-11 (UoSAT-2) is now transmitting telemetry data after weeks of silence.

Over the weekend of 11th to 13th May, dedicated radio amateurs at Stanford Research International in California and their outpost in Greenland heard very weak signals emanating from the satellite command RECEIVERS which, by their nature of operation, generate small signals on a frequency near to that which they normally listen. These signals told the University satellite team that their craft was still alive, although at this time the chances of complete recovery were not known. Although this observation, the first one confirmed since launch, did not lead directly to recovering the satellite, it did confirm that the orbital predictions provided by the NASA tracking organisations were correct and that the object being tracked by the Surrey team was indeed UoSAT-2.

This morning (14th May) at 10:24 GMT, with Dr. Martin Sweeting (UoSAT project manager) abroad on holiday, Neville Bean and Roger Peel, full time satellite researchers in the Department of Electronic and Electrical Engineering continued to command the satellite using its 144MHz uplink, to no effect. At 11:01GMT (12:01 BST), Neville made further command attempts on 438MHz, and after a brief stream of initialisation commands, the main UoSAT-2 beacon (145.825MHz) was powered up at 11:05.

The signals from the spacecraft were as strong as the last ones heard from it on the 1st March, when it stopped transmitting shortly after launch. Telemetry data, from the initial two orbital passes over Guildford, appears to be very encouraging, with temperatures around -5 to 0 degrees centigrade, as expected, and a battery voltage of 14.6 volts. The spacecraft is still spinning, but this will have stabilised since the previous data received immediately after launch, ready for attitude control manoeuvres. These will not start until after the causes of the 11 week silence have been investigated, a process that itself may take many weeks in order to exercise the caution necessary in this situation.

The UoSAT-2 spacecraft will be transmitting telemetry data continuously for the next few days while initial checks are made on the telecommand system, but after this other data formats will be generated using the spacecraft computer to check further the spacecraft's health.

Initially, the University of Surrey is encouraging radio amateurs and schools used to collecting data from UoSAT-1 to send them all the telemetry they receive from UoSAT-2, so that the picture of its current state can be generated as soon as possible. The AMSAT series of amateur-radio oriented satellites benefit greatly from the thousands of receiving stations around the world who are able to send such data back to the controlling organisation.

Subj: Oscar-11 status

Oscar-11 continues to transmit telemetry on 145.825 MHz while we examine the telemetry received and investigate the reasons for the last 11 weeks of silence.

The telemetry looks very good - in other words, as when the craft 'died', we have no indication of a failure mode. The only major difference is that the overall temperature has fallen from around 15c at launch to around 0c or -5 (which is close to that expected).

The telecommand reliability is currently very poor on 438MHz, indeed following the one 438 command which switched the 145MHz beacon, only 4 more commands were accepted during the following 4 passes on Monday. Today (still trying 438MHz for completeness over passes under all orbital conditions) we only succeeded in successfully entering 2 more sets of 2 commands. All commands so far have purely toggled a status bit in the telemetry (the LSB in channel 61) and not had any switching effect.

Efforts later this evening and tomorrow will centre on sending short bursts of commands on 144MHz. Bearing in mind that the command station 145MHz receivers will be flattenned by the transmissions, we will have to stop to see whether the commands have had any effect. [Remember that G3YJO is on holiday and that our remote receiving station is in his spare room!]

Assuming no major discoveries, we will switch the 145MHz beacon to audio and digital "bent pipe" modes in the next couple of days to check the command receivers and decoders. This may tell us how to modify our transmissions to improve the command uplink performance. Note that these diagnostics will generate peculiar noises and/or digital data on the 145MHz downlink - this is expected and unavoidable if we are to sort the problems out in finite time. We will try and restore telemetry before the weekend, and leave Oscar-11 in this mode over the weekend.

Please note that, due to the current state of the command uplink, bootstrapping the 1802 computer will be time consuming (at == 6-10 commands / day!) and we do not intend to do this until after the weekend. Then we will start expanding the output repertoire.

[]

The folks here in St. Louis rely almost entirely on one site for news feeds.
Most of the sites are low-budget and/or university sites, and just can't
afford to call ihnp4 continuously. There is a local packet radio group
which I have not yet been able to contact, but thought I would bring
the question up here anyway.

What we would like to do is get news via radio from any reliable site.
I know nothing about this technology other than the software end of
data communications and some satellite experience. Could those with
information please mail me with any ideas? Are other people passing news
via radio elsewhere in the world?

thanks in advance,
eric

What does someone with a Bell 202 modem have to do to receive the
telemetry? We have hardware and software expertise available.

Would someone please explain the difference between versions 3.0 and
3.1 of the TAPR TNCs? (P.S. the answer '0.1' has been received and rejected)

Ta

Receiving UO-11 telemetry is much like UO-9, except that there are some
important differences.

1. The deviation of the data subcarrier is considerably higher. This makes
for much improved copy in my experience.
2. THE MARK AND SPACE TONES ARE REVERSED relative to UO-9 (and to the Bell
202 modem standard.) If you cannot hack up your modem to invert data,
you'll have to do it externally. My own solution to this problem was to
add a 7486 exclusive-OR gate to the serial/parallel I/O card on my
computer. A bit from the parallel port controls whether the 7486 inverts
the incoming data stream that is fed to the UART.
3. The resulting data stream is conventional 1200 baud asynchronous ASCII,
and may be displayed directly on a terminal. However, the telemetry mode
that the spacecraft is currently in produces page after page of hexadecimal
digits, so the best way to see what's going on is with a decoding program.
Since each channel is checksummed this time, decoding is much more
reliable. I have written a C program to do this which works pretty well,
and even regains "synchronization" with the data stream quickly after
a noise burst. I can post this program here or on net.sources if anyone
is interested.

On the pass that just ended at my QTH, UO-11 is still transmitting
strong telemetry on 145.825.

73, Phil, KA9Q

Up to the minute news from the worlds of amateur radio, personal computing and emerging electronics. While no guarantee is made, information is from sources we believe to be reliable. May be reproduced providing credit is given to The W5YI Report.

In this issue:

- Dayton HamVention News
- Packet Radio
- FCC Issues More Ham Tests
- and more...

HamNet thanks Fred Maia, W5YI, for permission to excerpt this Electronic Edition of his W5YI Report. The full ten-page biweekly newsletter is available by mail for $18 per year from Fred at PO Box 10101, Dallas, TX 75207.

DAYTON HAMVENTION '84 - Huge Success

Around 21,000 avid amateurs enjoying splendid weather crowded the Hara

Arena this year for the 33rd annual Dayton GamVention. Reports from exhibitors as well as flea market operators indicated record sales! Smiling amateurs loaded with new purchases and flea market treasures confirmed that visitors were not just looking.

Around 350 applicants took the amateur exams under the new VE (Volunteer Examiner) program. This was the first large scale test session under the new amateur self-testing concept. The exams were held at the Maridale High School close to the arena. About 600 Technician and General Class Elements were administered. Observers were on hand from several other VEC's (Volunteer Examiner Coordinators) and the ARRL to observe the process and obtain first hand experience.

The reorganized flea market operation drew high praise from the exhibitors. All spaces were reserved through advance sales. The 1280 spaces on about 15 acres (all on black top) were sold out a month prior to the HamVention.

Some 30 forums covering just about every aspect of amateur radio drew good crowds as usual. The new forum rooms isolated from other HamVention activities were a great improvement and released the area previously used for about 50 additional exhibitors.

About 1,250 people attended the Grand Banquet on Saturday evening April 28th, 1984, to honor this year's award winners and hear former ARRL president Harry Dannals (W2HD) speak on his favorite subject, Amateur Radio.

This year a new category was added to the HamVention banquet awards. In recognition of the fact that amateur radio contributed greatly to the technical advancement of electronics and that amateurs are still advancing the state of the art, the Board decided to add the Technical Award. The award recognizes the technical contribution the individual has made.

This year's winners are:

Amateur of the Year: Dave Bell (W6AQ). Dave was recognized for applying his movie making talents to furthering amateur radio. Dave has produced many of the promotional films currently available on amateur radio.

Special Achievement Award: Ethel Smith (K4LMB) was recognized for her successful efforts to bring women into amateur radio. As founder of the YLRL, she has been an inspiration to many a young lady.

Technical Achievement: Lyle Johnson (WA7GXB) was recognized for his technical contribution in the packet radio area - especially the development of the Terminal Node Controller.

In addition to the three HamVention Awards, a new Dayton Amateur Radio Association award was presented during the ceremony - the DARA Distinguished Service Award went to Robert S. Zimmerman (W8ZM). Bob was recognized for his many years of dedicated service to the Dayton Amateur Radio Association.

The winner of the main prize (a complete Drake TR-5 station) was

Camille S. Marie (W8EPR) of Pikeville, Maryland. This year's prize chest broke all records with about $43,000 in prizes awarded to the lucky ticketholders over the three day period. The exhibitors were especially generous this year.

The top prize winners:

Complete ICOM IC-751 station (including the 2 KL linear amplifier): Catherine Hodson, (XYL of W9HOT), Greencastle, IN.

Complete Kenwood TS-430S station and accessories: James Leonard of Aliquitta, PA (W3GQT).

Solarex Photovoltaic System to Thomas Jenkins (N9AMR) of Indianapolis, IN.

Drake L-& Linear Amplifier was won by Walter Caudle of Connersville, IN.

The Ladies Alternative Activities Program, as usual, had many outstanding attractions and was very well attended. The parting comments of the visitors this year were highly complimentary.

PACKET RADIO - Mode of the Future

Every year at Dayton, I try to find a new technology sneaking into amateur radio. Code readers, computer-interfaced RTTY, amateur earth stations were new to me in prior years. Last year, I saw AMTOR error-free RTTY terminals. This year packet radio emerged with commercial offerings by both AEA (Advanced Electronic Applications, Inc.) and TAPR, the Tucson Amateur Packet Radio Corporation (PO Box 22888, Tucson, AZ 85734).

TAPR is a non-profit research and development group comprised solely of volunteers who are dedicated to the development of packet radio technology for the amateur radio community. It was formed in 1981 originally as a club and incorporated in 1982. From the beginning, the intention was to create an inexpensive way for hams to participate in this mode of communication.

Dayton attendees were very interested in it, but few seemed to know what it was. After the banquet which honored (among others) Lyle Johnson, WA7GXD, for his amateur packet radio development work, I went by the TAPR booth and spoke to Lyle to learn about packet radio.

Packet radio is a means of digital communication not too much unlike RTTY or AMTOR except (at 1200 baud) about 15 QSO's can be supported on a packet channel - each having the equivalent of 60 WPM RTTY. A very efficient use of point-to-point, rather than a braodcast medium in that it is addressable to a particular terminal.

AMTOR is a 3-character self-checking communications system. Packet radio, on the other hand, has 128 ASCII character "packets" each with an address "header". Like AMTOR, it has an error-checking mechanism with automatic repeat if a damaged message is transmitted.

To operate packet radio you need a transceiver, a terminal (such as a personal computer) and a controller to direct the message to your terminal or retransmit it further down the line. Packet radio not only operates on VHF, but on HF... even through satellites such as AMSAT OSCAR 10 and PACSAT - a new satellite designed for packet radio.

PACSAT will have a microprocessor and 4 million bytes (characters) of memory. A ground station can send a message intended for another ham to the satellite. The bird will store the message in its memory until the other hamd checks in and retrieves his messages... sort of a Buck Rogers "flying mailbox".

PACSAT will be in a low earth polar orbit (400-600 miles high) providing coverage of the entire earth. Because it will be in low orbit and becasue it will use a form of wide shift FSK, there will be no need for large steerable antennas and doppler correction. This makes automatic operation very simple and relatively inexpensive. You will need only about ten watts and a ground plane antenna to reach the satellite.

The AEA PKT-1 Packet Controller or the TAPR TNC allow you to "digipeat" your messages to their final desitnations through up to eight separate digital packet repeaters. Every packet radio station is actually an unattended repeater with automatic CW ID. If the message isn't for you, it is further retransmitted to the next nearest packet station and on the call sign names in the header.

Cost of the controller is in the $175 to $350 range. TAPR's is in kit form and is one of the finest products I have ever seen when you consider that it was designed and produced by amateur volunteers - truly a very professional job. The documentation and workmanship is absolutely marvelous!

Packet radio isn't new (although new to me!). As early as 1978, Canadian amateurs (whose government had the early foresight to allow other than the Morse and Baudot codes) were communicating via packet radio. (See 73 Magazine, December 1978, page 192). It wasn't until our FCC allowed ASCII that US amateurs took up the technology seriously. It is clearly the mode of the future and the DARA was clearly "on target" in honoring Lyle Johnson, WA7GXD, president of the TAPR Corporation for his development work.

NEW AMATEUR TESTS ISSUED

The FCC has re-issued the Novice Amateur Radio Operator License (Element 2) examination to coincide with recent changes in Part 97 Rules. The new NOvice Test question edition is dated February 1984 and replaces the July 1983 version.

In addition, the Commission had released the Advanced (Element 4A) and Amateur Extra Class (Element 4B) test questions. These were supposed to have been ready in time for the Dayton HamVention, but were still at the printers when Johnny Johnston (W3BE), FCC Personal Radio Branch Chief came to Dayton. He mailed them to me as soon as he returned to Washington.

Since all question lists have now been developed, the new volunteer examination program can now proceed in its entirety. Up until now, only Technician and General Class examinations could be given under the new (Tech and up) VE program. The Technician Class through Amateur Extra volunteer ham exam program is completely different from that of the Novice.

The Element 4A (Advanced Class) questions consist of:

Sub. Sec.	Total Questions	Subject	To Be Selected:
4A-A	60	Rules & Regulations	6
4A-B	10	Amateur Radio Practice I	1
4A-C	20	Radio Wave Propagation	2
4A-D	40	Amateur Radio Practice II	4
4A-E	100	Electrical Principles	10
4A-F	60	Circuit Components	6
4A-G	100	Practical Circuits	10
4A-H	60	Signals & Emissions	6
4A-I	50	Antennas & Feedlines	5

Total: 500 Questions of which 50 are selected. Passing score is 37 correct out of 50.

The Element 4B (Amateur Extra Class) questions consist of:

Sub. Sec.	Total Questions	Subject	To Be Selected:
4B-A	80	Rules and Regulations	8
4B-B	20	Operating Procedures	2
4B-C	10	Radio Wave Propagation	1
4B-D	30	Amateur Radio Practice	3
4B-E	70	Electrical Principles	7
4B-F	50	Circuit Components	5
4B-G	60	Practical Circuits	6
4B-H	30	Signals & Emissions	3
4B-I	50	Antennas & Feedlines	5

Total: 400 Questions of which 40 are selected. Passing score is 30 correct out of 40.

A booklet containing the FCC Amateur Radio Operator Study Guide and all 1,600 actual test questions for all ham classes (Novice through Extra) is available for $2.00 plus 50 cents postage from:

COMPLETE AMATEUR RIG for sale, cost $1800.00 asking $1200.00.
Included are as follows:

TENTEC Transceiver model OMNI D
     200 Watts input Pwr. Digital tuning, 6 bands

TENTEC 12 V power supply for transceiver

GONSET 1KW linear amplifier

ASTATIC D104 MICROPHONE with PTT stand.

TA-33 Triband beam antenna

CDR HAM-III Heavy Duty antenna rotor and control box

1KW low pass filter

100' RG8/U COAX

Transmit receive coaxial relay (necessary only when linear used).

Home brew solid state electronic keyer.

I just received the sample issue of "The International Shortwave Listener's Program Guide", which I requested just a week ago, and the offer of which I posted on net.ham-radio last week. It is Vol 1, No. 2, and is better than issue number 1, it seems, according to the description of that earlier issue posted by another as a followup to my announcement. It was also really free; I had sent 37 cents as requested, and this copy has an uncancelled 37-cent stamp!

Anyway, the subscription rate is $19.95 for 12 issues, which is higher than Review of International Broadcasting, and I think RIB is somewhat better than this. However, they are distinctly different types of publications, so, if the cost is unimportant to you, it may well be worthwhile to get both. RIB is a listeners/readers' forum. The ISWLPG is more of a traditional magazine, with articles and columns. It is rather cheaply made, printed on pulp newsprint-type paper, 32 pages, the cover is the same newsprint, 8 1/2 X 11-inch format, with a readable typewriter-style typeface. The "Program Guide" section is in much smaller, rather harder-to-read print.

About two-thirds of the magazine is articles; the rest is listings of broadcasts in English, program summaries from BBC and RCI (very limited; the BBC info is one page obviously photo-copied from London Calling with new headlines typed in; probably a cut-and-paste-up process), and the "Program Guide". The notes clearly state that this "Guide" section is limited to about 10 major broadcasters, with a Malaysian station thrown in for grins. The "Guide" section lists GMT times, station name, and program title. No frequencies. To find the appropriate frequency for the time and station you see listed in the "Guide", you have to turn back to the separate listings of "Broadcasts in English". Rather annoying unless you have memorized the best frequencies for your usual listening times and favorite stations. Another side effect of the style is a wasted string of listings each hour for "news".

The articles are rather good. They have a number of well-known DXers on the staff who have contributed some surveys and discussions that are worth reading. A few articles are fairly obviously station PR handouts, but not the majority. The main article is a long interview with Ian McFarland of RCI. A technical questions column is planned, but this issue had no receiver reviews or other technical information.

I still haven't decided whether or not to subscribe myself. These SWL magazines have come and gone over the past decades, and subscribers have been left with lost funds when they failed. RIB has been a notable exception; it has continued for 7 or 8 years steadily. (I think that is because the others have been explicitly commercial ventures, and never could turn a profit. RIB is a one-man labor of dedication, and has been priced to recover costs, not to make Glenn Hauser a living. [He's not rich, he just works 27 hours a day!])

In case you didn't keep my original posting, with the address and info on the free sample, I append it below:

An item of interest to all shortwave listeners, from this weekend's Radio Canada International's SWL Digest program:

A free sample issue of the new "International Shortwave Listener's Program Guide" periodical is being made available on request for the cost of postage. US residents send 37 cents in coin (Canadians send 70 cents in [I suppose] Canadian coin, overseas send 7 IRC's) to:

Larry Miller
Miller Publishing
424 W. Jefferson St.
Media, PA 19063 USA

Along with your name & address, so they know where to send it.

(I don't know why they want coins instead of stamps from US respondents, but I sent them the coins as requested.)

Will Martin

qst de k9eui
hr dx bulletin nr 18 from arrl headquarters
newington ct may 18, 1984
to all radio amateurs bt

thanks to k1xm, k1mm, w1trc and the southern new england dx association for the following dx information.

south sudan. rumor has it that tl8ge/st0 will be on 14225 khz at 0400z friday.

kermadec. zl8afh has been active at 2215z on 21272 khz.

martinique. fm7wd continues to be active on 28525 khz at 2230z. qsl to w3hnk.

french polynesia. fo8kp has been active on 14002 khz at 0130z. he has also been active on 40 meters at around 0800z.

the gambia. c53al has been active on 3798 khz at 0115 to 0130z. qsl to ka2cde.

cape verde. d44bs, sergio, has been on 3798 khz after about 0100z.

turkey. ta1mn, mustas, continues to be active on 14035 khz at 0200z.

china qsls. at dayton, ve7bc reported that cards from the recent by4aa operation are being answered by his xyl at the rate of 70 per night. please be patient.

san felix. from dxpedition leader ce3gn comes word that no licenses or landing permit have been obtained for an operation from san felix.

wallace island. fw8af, francis, will be on saturday at 0800z on 14236 khz.

late news. check 14236 khz each day at 0300z. the international dx association net often has late breaking dx information.

6 meters. the band continues to be hot with sporadic e openings almost daily. best times to watch are late morning

and late evening hours, local time. also, dont forget the 6 meter sprint contest from 7 to 11 pm local time this saturday ar

hr arrl bulletin nr 38 from arrl headquarters
newington ct may 18, 1984
to all radio amateurs bt

space shuttle audio from the sts 41d mission will be retransmitted by the goddard amateur radio club, wa3nan, beginning approximately one hour before launch time and continuing until the shuttle lands. the launch of the discovry is scheduled for 8 am edt on june 19.

interested persons in the washington, dc, area will be able to listen to shuttle communications on 147.45 mhz. garc will also transmit shuttle audio on a maximum of three hf frequencies at a time, using 3860, 7185, 14295, 21390 and 28650 khz. the primary frequency will be 3860 khz.

the retransmissions will be intermittent as dictated by the astronauts sleep schedule, loss of signal, los, or acquisition of signal, aos, and wa3nan operator scheduling.

there is no amateur radio activity scheduled for this mission ar

qst de k9eui
hr propagation forecast bulletin nr 21 from arrl headquarters
newington ct may 21, 1984
to all radio amateurs bt

as of may 20, the solar flux has been higher than at the same point in previous solar rotations continuously for 30 days. in addition, the daily flux average for all of 1984 to date is some 15 percent above the 1983 daily average.

the flux was rising at bulletin time, but at a slower rate than in april, so the flux curve is likely to drop below that of a month ago during this week. as in late april, major solar flares are occurring frequently. these will bring degraded propagation on all hf bands may 21 through 26 and 28 through 31. a major geomagnetic storm in progress as this bulletin was in preparation brought auroral conditions on 50 and 144 mhz in the northeastern u.s. there was also a late season transequatorial 50 mhz opening to south and central america on may 19. sporadic e propagation was almost a daily occurrence on 28 and 50 mhz after the middle of may. it will reach a broad peak during june.

american sunspot numbers for may 3 through 9 were between 25 and 79 with a mean of 48.9 ar

TO : Packet Radio
FR : Lyle
RE : Pete Moves On

On May 9th, I received a telephone call from TAPR Executive Vice President, Peter Eaton, WB9FLW. The purpose of the call was singular -- Pete was resigning from Office in TAPR.

Pete explained that he had devoted the last 2-1/2 years of his life to Amateur packet radio activities, but the time had come for him to end his "retirement" and divert his energies to his personal life. He requested that we respect his decision.

Reluctantly, but in conformance with Pete's desires, I accepted.

Pete's will be a tough act to follow.

He was first involved with TAPR in early 1982. He represented TAPR at the Dayton Packet Forum that April, showing off one of the then-new Alpha boards.

In June, 1982, he founded SLAPR, a St. Louis-based packet group that achieved national recognition. He was SLAPR's President from its inception until last December, when he resigned to more fully devote his energies at the national and international levels.

Acting as Beta Coordinator for the St. Louis area, Pete went into every corner of the metropolitan environs and spoke of Packet to every ham he met. The St. Louis Beta site was the first on the air, with Beta boards hand-carried from Tucson, by Pete, on January 31, 1983.

In June of '82, he flew to San Diego to help work the Convention that launched TAPR as a more-than-Arizona organization.

During the summer of 1982, Pete located a transformer manufacturer in Illinois to make the custom power transformers for the Beta boards.

He also came to Arizona and video-taped the June TAPR meeting and subsequent introductory tape that followed.

During the October, 1982, AMSAT-sponsored meeting that adopted the AX.25 protocol, Pete accepted the responsibility for getting the Beta PC board laid out.

When push came to shove in November, 1982, Pete arranged to have a couple prototype Beta boards made and shipped to Tucson. He then came himself and spent nearly a month with us in Tucson, working 16-hour days, day after day, to help hauncho the Beta production.

He was with us on Black Thursday, and helped TAPR survive that crisis.

After spending so much time in Tucson, Pete nevertheless flew back for the Annual Meeting. This was less than 1 week after hand-carrying the Beta Boards to St. Louis...

He was primarily responsible for the Amateur Packet Radio booth at Dayton last year, working tirelessly for the professional appearance and good first impression that so many of you commented on.

He was on-camera for the "Introduction to Packet Radio" videotape done in Des Moines last summer.

Pete helped in the preparation of the kit TNC manual, and did considerable work on the PC-board illustrations.

He arranged for the kit board layout, and was one of the kit test-board assemblers (his is kit TNC number one...).

The 3-ring TNC manual cover was Pete's doing.

After his election to Executive Vice President at the Board of Director's meeting last February, he plunged into the tasks of coordinating the cabinet project and preparing for Dayton.

Pete was a prime instigator of the efforts to have the first-ever Dayton Hamvention Award for Technical Excellence bestowed on the TAPR TNC.

The new TNC brochure was arranged by him.

In the midst of all of this activity, Pete has travelled extensively throughout the midwest, spreading the word on packet to hamfests, clubs, conventions -- anyone who would listen.

As you can see, Pete Eaton has been a selfless dynamo, directing considerable energy, time and money into packet radio. Without his efforts, packet radio as a whole, and TAPR in particular, would not be close to the stature it presently enjoys. He has earned the nickname, "Packet Pete".

We will miss the insight, devotion and energy he brought to the
Office of TAPR Executive Vice President.

We offer him our full support for his future endeavors, and wish
him the best of the best in all he undertakes.

Subj: Oscar-11 status
  During the morning passes here at Surrey, the first
successful attempt at commanding Oscar-11 has been made,
following the rise in temperatures on board.
  The three commands to switch the beacon into audio
feed-through mode were accepted within 2 seconds of each other
and the uplink at 438MHz was inspected on the 145MHz downlink.
 Digital data transmitted through this path was successfully
decoded and compared back in the groundstation, indicating
that the receivers are functioning, but the command
reliability is still poor, although good enough to switch back
to telemetry using the feedback from the received audio.
Further tests on the decoders on the spacecraft will be done
when possible in the next few days. Further audio tests are
also required.
  The rising temperature, and effect on command reliability,
will determine whether we can boot the main computer and
perform several other checks in the next few days.

Subj: Uo11 status (funny noises)
Sorry, folks!

Due to the loss of our IPSS link for nearly 36 hours from
Sunday through yesterday, (due initially to a power cut), we
were unable to let you all know that we have succeeded in
putting UoSAT-2 into a digital feed-through mode to
investigate the command unreliability.

The audio feed-through (described in the preceeding message
which we have just sent) showed that the receiver on 438MHz is
working adequately, if not well, and that further tests will
have to be done in the near future to further characterise the
situation.

The digital loop-through tests are not producing sensible
outputs as yet, indicating possilble problems with the
receiver / decoder interface. We are currently analysing the
results of this morning's latest efforts and will report when
appropriate.

K5JB06.TXT   15-May-84 8580   Accesses: 18

    Keywords: K5JB PACKET

    Column by Joe Bushwell, K5JB, describing his Packet Radio
    experiences at the 1984 Dayton HamVention.

DAYTON - PACKET UPDATE

During the visit to Dayton, I got an opportunity to attend the
Packet Radio presentation and meet some of tne movers and
shakers. Two people whom I especially admire, Lyle Johnson,
WA7GXD, President of Tucson Amateur Packet Radio Corp. and Gil
Boelke, W2EUP, of GLB Electronics took turns on the platform
along with representatives from St Louis (SLAPR), Dayton (Miami

Valley FM Association), AMRAD, and the ARRL (Paul Rinaldo, W4RI) . After the presentation I got to meet Gil and ask him if he minded my modifying the code in the PK-1. He said heck no and to call the company later to get specific answers to my questions. (...which I subsequently did, and to which they responded in writing with specific answers to my questions. This is without any knowlege of my reputation as an agitator/ instigator). I chose my questions carefully though because firmware is a really touchy subject. I have a real warm feeling about the GLB folks. I think their aim is to please. The next morning I got to visit briefly with Lyle Johnson, WA7GXD, who is certainly one of the most energetic and creative persons I have encountered. I can understand how he has been such a sparkplug for the TAPR activity...).

There are currently six sources of TNC's or alternate methods of getting into Packet Radio; AEA's, Ashby and Son's (K2TKN & KA2OEG), GLB's, Bob Richardson's (W4UCH), TAPR's, and VADCG's. Someone in AMRAD is working on a TNC called a PAD (Packet Assembler - Disassembler) which is apparently slanted toward S-100 Bus Computer systems. AEA (Advanced Electronic Applications) announced its TNC at the Hamvention but had no representative on the program. AEA has a handsome design that looks like a development from the TAPR TNC, for a price of about $500. I saw no evidence of the Ashby and Son TNC at the show but I could have missed it. Likewise, I saw no evidence of Bob Richardson's (W4UCH) Radio Snack model 1 and 3 program, though it was respectfully mentioned by Gil Boehm from GLB. It seems that since Bob and Gil are neighbors, they regularlly communicate on program design questions but developed their programs independently.

Gil defended the GLB's Spartan design by statingthat he Value Engineered the problem to strike an economical compromise in hardware v.s. software trade-offs and decide whether to add audio shaping and filtering to the PK-1. He was challanged by a later AMRAD speaker who felt that the five bucks the filter would have cost would be a cheap 1.5 dB improvement if one were working satellites. Later when Gil answered a question about whether the TP-1 would run 300 Baud for HF operation, he answered both points when he stated that its design goal just didn't include those applications.

There still is no absolute answer to the question, "Which is better, the GLB or the TAPR?" It depends for which use the TNC is intended. For the benefit of you who have not been following this discussion since last January, the following salient differences exist between the two.

The TAPR TNC costs approximately $250.00 in kit form, has an optional cabinet for about $70.00, runs Vancouver and AX.25 protocol and runs on 120 Vac.

The GLB costs approximately $150.00 assembled, has an optional cabinet for about $25.00, runs both protocols and runs on 12 Vdc.

The TAPR TNC uses hardware (Western Digital 1933 SDLC) to make and read packets, the GLB TNC does all in software (firmware). The hardware v.s. software is the major difference between the two and accounts for most of the cost difference. The only performance disadvantage I have found in the GLB approach is the packet reception disruption that occurs if a key is touched on the terminal during the reception process. The keyboard has interrupt priority and the Processor must service the keyboard at the expense of its packet activities. Gil (and the accompanying TP-1 literature) advises that the computer, which is most often the case used to act as a terminal, be programmed to accept the input off-line from the TNC and send it, when ready, to he TNC at a high data rate, reducing the probability of a clash with packet operation. The TAPR TNC, with its packet handling hardware, is not placing any strain on the processor to make the data input and output process appear transparent to the operator. Mark, WD5DYI, is now using his TP-1 regularlly and this disadvantage is much more apparent as he creates his epistle sized packets. I had not noticed the problem so much because I usually send rather terse packets, or type in short, five character, bursts of about a thousand words per minute, spending the rest of the time looking for the next five keys! Packets easily slip in while I am looking. Mark is not a programmer but he will eventually want to do the line editing on his computer. I toyed with the idea on the Model-100 but got bogged down in the creeping elegance of interrupt handling from the RS-232 port.

The TAPR documention is awesome and contributes to a portion of the price difference. Since this is a kit, construction and adjustment instructions cause some of the book's volume but, in fact, the TNC is one of the most thoroughly documented pieces of hardware I have ever seen.

The GLB documentation has come a long way since I bought mine. It is now 35 typewritten pages bound looseleaf between a couple of nice, blue covers, with a command cross reference chart printed on the back for easy reference. Also, it now has a schematic! The manual is certainly adequate to support the PK-1 and its many features.

The TAPR hardware was designed for flexibility in order to enable as many conceivable modifications as possible so that it could be used for other applications. It has a socket for an external modem in case one is impatient with 1200 Baud, or just wants to try external hardware. Its audio filtering can be easily modified for HF use by installing suitable resistors on DIP headers. As already mentioned, with the GLB you roll your own if you want audio filtering or shaping. If you run out of

Packet things to do with the TAPR TNC, you can get the EPROM programmer from TAPR, plug it into the socket provided on the TNC and do your own thing. These functions were simply not part of the requirements in the GLB design concept. (Like a friend of mine says, "If you wanted the Penguin to fly you should have included it in the specs!"

The TAPR TNC can be made to operate the radio side from 50 to 4800 Baud half or full duplex while the GLB PK-1 is restricted to 600 and 1200 Baud, half duplex. N5MS and I experimented with 600 Baud over a noisy path and it didn't seem to be any better than the 1200 Baud speed. To gain full benefit we should have modified the firs (Mark, WD5DYI, Joe, WA5FLT, and I) rate them in day-to-day use. So far, I have enjoyed my particular application, using it portable with the Model-100 computer as a terminal. Joe, WA5FLT, also has a TAPR TNC and can provide his opinions as soon as he gains experience. He intends to put his into remote operation. This is a special feature incorporated in the GLB that requires adding only a transceiver, watchdog timer and transmitter timeout time. The TNC receives its commands via the packet channel.

The decision on which TNC to buy is a personal one. One has to first determine the function he wishes to perform. Lyle, WA7GXD, put it most succinctly when he commented that the TAPR TNC was intended for the bearded experimenter down in the basement (He sports a handsome bush). On the other hand, Gil claims the GLB PK-1 was not intended to be all things to all people.

AS PROMISED, HERE IS AN UPDATE ON PACKET RADIO IN HARTFORD, AND AT ARRL HEADQUARTERS.

AT LEAGUE HEADQUARTERS, WE HAVE THE W1INF-5 DIGIPEATER. THE REPEATER IS A VHF ENGINEERING JOB RUNNING ON 145.01. WE ARE USING A VANCOUVER TNC WHICH BELONGS TO THE LEAGUE. THE MODEM IS THE BREAD-BOARD PROTOTYPE OF THE AM-7910 BASED MODEM WHICH I BUILT FOR THE 1985 HANDBOOK.

UNFORTUNATELY, HQ IS IN A HOLE, AND THE COVERAGE OF OUR 18-W MACHINE IS NOT GREAT. WE ARE LOOKING FOR A SITE WITH BETTER RANGE, BUT HAVE HAD NO TAKERS.

WE HAVE 3 OR 4 ACTIVE USERS AND MANY INTERESTED PARTIES -- WAITING FOR US TO GET THE GROUND-WORK DONE. THE PRESENT USERS ARE: KE3Z, WA1LOU AND I. JOHN BLOOM, KE3Z, RECENTLY JOINED THE ARRL LAB STAFF. JOHN IS FROM THE WASHINGTON, D.C. (AMRAD) GROUP. WA1LOU IS STAN HORZEPA, AUTHOR OF THE QST "ON LINE" COLUMN. WE ALSO HAVE AT LEAST ONE MYSTERY STATION -- THIS AFTERNOON I HEARD AB1U.

SINCE THE NEPRA PEOPLE HAVE PLACED A DIGIPEATER ON MT. GREYLOCK (MA) , WE MAY BE ABLE TO LINK TO BOSTON, COMPLETING HALF OF EASTNET. ALL THAT WE NEED IS A SLIGHTLY BETTER SITE, AND MULTI-REPEATER SOFTWARE FOR OUR VANCOUVER REPEATER.

WE HAVE BEGUN COLLECTING EQUIPMENT FOR A SATELLITE GATEWAY AT W1AW. BY THE TIME THE STA FOR AUTOMATED GATEWAY OPERATION GOES THROUGH, WE WILL BE ON THE AIR. THE ARRL WILL BE GIVING SOME FINANCIAL SUPPORT TO THE EFFORT, BUT WE STILL HAVE TO SCROUNGE AND "BOOST" A LOT OF EQUIPMENT.

FOR CONTROL OF THE TELEPORT, AND FOR A PACKET BULLETIN BOARD, WE HAVE

A COUPLE OF THE XEROX 820 BOARDS.
   JOHN AND I HAVE TO SPEND MUCH OF OUR TIME ON QST AND OTHER PUBLICATIONS, BUT WE HAVE BEEN DEVOTING A LOT OF TIME TO PACKET RELATED PROJECTS. SOME OF THESE PROJECTS: THE PACKET ADAPTIVE MODEM (FOR HF), A TUNING INDICATOR FOR HF AND SATELLITE PACKET, A SINGLE CHIP MODEM FOR BELL 202 AND 103 RADIO LINKS.
    WE HAVE HIT SOME SNAGS, AND HAVEN'T MET WITH AS MUCH LOCAL ENTHUSIASM AS WE WOULD LIKE, BUT WE WILL PUT NEWINGTON BACK ON THE TECHNICAL MAP. SINCE PLR HAS COME TO THE LEAGUE, WE STAND A CHANCE OF GETTING A DECENT TECHNICAL REPUTATION. IF THERE IS ANYTHING WE MIGHT BE ABLE TO HELP YOU WITH, GIVE ME A CALL. IF YOU HAVE ANYTHING THAT COULD BE PUBLISHED, SEND IT!
73,
JEFF WARD, K8KA.

Until recently, most scanners have started their UHF coverage at 420 MHz. The newer models are providing broader frequency coverage of this area. My Radio Shack PRO-30, provides UHF FM reception down to 390 MHz.

I have often been asked: "Who uses this frequency range?"
The most interesting stations in this range are those of a law enforcement nature (FBI, DEA, Border Patrol, etc.), but this information is a bit sensitive.

Here is an UNCLASSIFIED list of US Government stations purported to operate in Illinois (an perhaps other areas) in this frequency range:

390.8000	?	US: Air Force, Scott AFB, airdrome ctl stn, AM (Belleville)
390.9000	?	US: FAA, airdrome ctl stn, AM (Chicago)
394.5000	?	US: Air Force, O'Hare Airport, 400F9 emission (Chicago)

```
 395.8000    ?          US: FAA, airdrome ctl stn, AM (Springfield)

Sorry to clutter up this mailing list with a request like
this, but I don't know who the administrator is. Hopefully
s/he is listening. Or someone who knows will forward this
message. In any case, I would like RSHAPIRO@BBNA to be added
to the info-hams mailing list.

Thanks,
richard

Just like to mention that I, for one, am glad to see the scanner frequency
information, no matter the geographic area, posted on the net. In regards
to this particular posting, this might be old news to those of you with
scanners, but many Regency synthesized models can be programmed out-of-band
simply by pressing the decimal point keypad before entering the frequency
while in "program" mode. This works on my K500, but either there is no
traffic locally (St. Louis) on the frequencies or at the times I've tried
this, or the scanner's RF circuits are not responsive out-of-band. (Probably
the latter -- I've tried scanning thru the CB band this way and got nothing,
while there are many signals on CB coming in on a shortwave radio right
next to the scanner.)

Bearcat scanners can be tricked to respond out-of-band with complex
series of commands. These have been written up in Monitoring Times.

Will

Re: Synchronism

Keith,

Some years ago I saw a good explanation of how a teletype printer becomes synchronized if the signal is turned on in the middle of a character.

That is, suppose you just happen to switch the signal on in the middle of a character, and the first bit it sees is a spacing data character. How does it finally figure out that what it saw wasn't a start bit, and get itself properly synchronized with the real start bit of subsequent characters?

Do you recall such an article, or do you have a good description of the process yourself?

Seems to me that I might even have included a description of it in one of my articles in RTTY Journal about 10 or 12 years ago, but I can't find it, and I can't recall my favorite description that I like to give to newcomers!

Thanks -- Bill, N5KR

In the packet arena you forgot a long time ham company GLB. Their TNC is $150 wired and tested. They had a booth inside. Plus they announced a whole packet station, transmitter/receiver and watchdog timer for use as a digipeater and/or a home station.....

From: Andy Cromarty <andy@aids-unix>

  I'm in the process of attempting to set up a bulletin board and
computer mail system accessible by packet radio, under the auspices
of the local Red Cross. Once installed, the system will be available
to all hams in the Palo Alto area (although we have a special interest
in Red Cross disaster-related traffic handling).

  We have an old TRS-80/I with one floppy drive available, plus the necessary
radio & TNC equipment. All that's lacking now is the bulletin board software.

  Does anyone have good bulletin board software (or a reliable pointer
to it) that will run on a TRS-80 or can be easily converted?

     thanks,   andy N6JLJ

From: Bob Clements <clements@bbn-cd.arpa>

Andy, and net:

We in the greater Boston area are a veritable hotbed of Packet Radio

activity. We have over 50 stations on within the range of a couple
of digipeaters. There are three bulletin boards on in this group.
As it happens, I will be posting this software in a couple of weeks
for all to use. Unfortunately, your specific request for TRS-80
environment means you won't be able to use this directly.
What we have is a system that runs on the Xerox 820 board with
a TAPR TNC. I have one running beside me (at K1BC) and the other
two are at K1OJH (who used to run a BBS on a TI99 and TAPR TNC)
and at W0RLI who is the main author of this system.

Given the recent burst of Xerox 820's you might want to scrounge one up
and use this system.

I'll be putting it on the repository at SIMTEL20, and will send out
a message when it's there. We are late in the Beta test phase now, and
copies are going to KA9Q and to some of the other groups this week.

The May 1983 issue of Popular Communications magazine lists the following HF frequencies for Space Shuttle related monitoring:

2.622 NASA booster rocket recovery
3.385 NASA tracking
3.395 NASA tracking
5.190 NASA tracking vessels
5.810 NASA booster recovery vessels
6.708 NASA aircraft
6.896 NASA aircraft
6.983 NASA tracking
7.461 NASA aircraft
7.675 NASA Kennedy operations
7.765 NASA aircaft
10.780 USAF "Cape Radio" (primary)
11.205 NASA Pacific operations
11.407 NASA booster rcoket recovery
14.456 NASA tracking
20.186 NASA tracking (Ascension Island)
20.191 NASA tracking (Ascension Island)
20.390 USAF "Cape Radio" (secondary)

Other VHF, UHF, and microwave frequencies are listed in this article on pages 38 and 39.

(take this)

 I would also like to know more about amatuer radio, and what equipment
 I should buy if I just want to listen and not broadcast(so I don't sink
 a lot of money into at first.

Aside from a few "sensitive" frequencies used by Postal Inspectors
for law enforcement type activities, here are some unclassified
Post Office frequencies for Illinois.

They are likely used in other areas of the country:

```
  27.5750    KSJ899    US: Postal Svc,    AM (Chicago)
 162.2250    KLM472   hUS: Postal Svc,    Bulk Mail Ctr, repeater
    (Forest  Park)
 163.3750    KLM547    US: Postal Svc (Marion)
         KTM447   US: Postal Svc (Chicago)
 164.9625    ?         US: Postal Svc (Chicago)
 164.9875    KUK226    US: Postal Svc (Chicago)
 170.1250    KVO711    US: Postal Svc (Chicago)
 171.6250    KPS247    US: Postal Svc (Forest Park)
 172.3000    KPS247    US: Postal Svc (Forest Park)
 406.3250    ?         US: Postal Svc (Des Plaines)
 408.0250    KGW285    US: Postal Svc (Chicago)
 408.0500    KBZ415    US: Postal Svc (Chicago)
 410.0000    KGW285    US: Postal Svc,    repeater (Chicago)
 410.2000    KBZ415    US: Postal Svc,    repeater (Chicago)
 410.3250    KHA325    US: Postal Svc (Chicago)
 416.9750    KGW285    US: Postal Svc (Chicago)
```

Perhaps the best way to find out about the subject if you're completely
new is to find an electronics or ham radio store. Many have books for
sale, including those sold by the American Radio Relay League (ARRL),
the primary US/Canadian ham organization. In particular, there are several
books which are written especially for the newcomer, containing license

study guides, etc. You should also locate a local ham club;
many have ongoing license study classes and in any case is a good way to
meet hams in your area. Most hams are very helpful to newcomers and you
may very well find an "Elmer" (a ham term for an experienced amateur who
befriends a beginner.) If you wish, you can write the ARRL at
225 Main St., Newington, CT 06111. Good luck!

Phil

The most useful program guide that I have found is the "International
Listening Guide: The Complete Directory of External Services in
English."

Most of it consists of program listings. Each pair of pages covers a 2
hour period. It lists transmissions in this period sorted by starting
time. It gives the frequencies and target areas for each. Each page
also lists separately news broadcasts during that time period, and DX
programs. The listings are more accurate than those of other publications
that I have seen.

The end of each issue gives a list of frequencies and the broadcasts on
each frequency. To save space, it only lists times here in 6 hour
segments.

The format of this publication changes slightly each time it is
published (mostly for the better). I conjecture that this is a result
of improvements to the computer program that prints the schedules. By
the way, the current issue is Volume 7, Number 25, so it has been
around for quite a while.

It is printed 4 times per year, corresponding to the seasonal broadcast
changes. It is printed and mailed (first class airmail) in W Germany
and arrives a few weeks after the program changes. The cost is only $6

(US) a year.

You can order from N.-American-Rep., Rob Harrington, PO Box 3434, Littleton, CO 80161. He takes USA checks or US dollar bills only! Outside the US, you can order direct from DX Listeners Service, c/o Bernd Friedewald, Merianstr. 2, D-3588 Homberg, West Germany. You can pay in bills, bank notes or checks. Some rates are: 4 British pounds, 8 Canadian dollars, 15 Dutch guilders, 10000 Italian Lira, 1500 Japanese yen, 6 US dollars, and 7 Australian dollars, all for a one year (four issue) subscription.

The deadline for getting the next issue is Aug 18 to the Colorado address and Aug 25 to West Germany.

The following is extracted from this week's Oscar-9 bulletin, giving the latest Oscar-11 news.

**** UoSAT Bulletin-76 25th May 1984 ****

** UoSAT-Oscar-11 Status **

Over the weekend of 11th to 13th May, dedicated radio amateurs at Stanford Research International in California and their outpost in Greenland (headed by Bob Leonard, KD6DG, at Stanford and Finn Steenstrup, OX3FS, at Sondre Stromfjord) heard very weak signals emanating from Oscar-11's command RECEIVERS which, by their nature of operation, generate small signals on a frequency near to that which they normally listen. These signals told the University satellite team

that their craft was still alive, although at this time the chances of complete recovery were not known. Although this observation, the first one confirmed since launch, did not lead directly to recovering the satellite, it did confirm that the orbital predictions provided by the NASA tracking organisations were correct and that the object being tracked by the Surrey team was indeed UoSAT-2.

On the morning of 14th May at 10:24 GMT, Neville Bean, G8NOB, and Roger Peel, G8NEF, continued to command the satellite using its 144MHz uplink, to no effect. At 11:01GMT (12:01 BST), Neville made further command attempts on 438MHz, and after a brief stream of initialisation commands, the main UoSAT-2 beacon (145.825MHz) was powered up at 11:05.

The signals from the spacecraft were as strong as the last ones heard from it on the 1st March, when it stopped transmitting shortly after launch. Telemetry data, from the initial two orbital passes over Guildford, appeared to be very encouraging, with temperatures around -5 to 0 degrees centigrade, as expected, and a battery voltage of 14.6 volts. The spacecraft was still spinning, but this had stabilised since the previous data received immediately after launch, ready for attitude control manoeuvres. These will not start until after the causes of the 11 week silence have been investigated, a process that itself may take many weeks in order to exercise the caution necessary in this situation.

The UoSAT-2 spacecraft will be transmitting telemetry data continuously for the next few days while initial checks are made on the telecommand system, but after this other data formats will be generated using the spacecraft computer to check further the spacecraft's health.

The most likely cause of the last 10 weeks silence is indicated by the very poor command uplinks. Indeed, only 8 commands were loaded into the spacecraft in the first 2 days after recovery. This accompanies a decrease in command decoder and battery temperatures, which is cyclic between -5c and -12c with a period of about 10 days. Commands are received - albeit infrequently - over only about 3-4 days of this cycle, explaining why the current investigations are proceeding cautiously. Since temperature fluctuations are connected intimately with sun-angle, and hence attitude, the command problems could be purely due to the spacecraft antennas pointing away from the earth during some parts of the precession cycle.

Further investigations are continuing with efforts to characterise the signals received by the spacecraft receivers, which are not performing as well as expected. In addition,

experiments to improve the performance of the data decoders (which convert the audio signals received into digital data for use by the telecommand logic) are under way, concentrating on pre-distortion of the uplink waveforms.

Stephen Hodgart, our attitude control expert at Guildford, has been working on an elementary magnetorquing manoeuvre which can be controlled to improve the average sun angle (and hence the temperature), the antenna pointing (always towards the ground over the Northern Hemisphere), and hence the command success rate, given a minimum of ground interaction in the process. This will be attempted on one of the next few 'warm' cycles, once all the possible side-effects have been evaluated.

** Oscar-11 Attitude - from Stephen Hodgart (UoS) **

The angular motion of UoSAT-2 has been estimated from the magnetometer data extracted from the pass over Guildford on orbit 1076.

This reveals a dominant transverse motion, a spin state approximating a 'flat spin' or 'tumbling', defined by a rotation of the z-axis about a spin axis in the plane of the x and y axes of the spacecraft. This arbitrary spin axis is the direction of the overall angular momentum vector and is parallel, within 1 or 2 degrees, to the plane of the orbit. The period is 42 seconds.

The motion is complicated by a slow z-spin oscillation with a period of 165 secs and an amplitude of +/- 45 degrees. This oscillation couples to the dominant transverse motion causing the flat spin to modulate into a nutational cone of a wide half-angle varying between 84 and 96 degrees, in synchronism with the z-spin oscillation. Every half-cycle this cone flattens for an instant to the pure flat spin and then inverts.

Further analysis using other orbital data is required to test for possible precessional change in the angular momentum, also to test for any continuous advance in the z-axis rotation in addition to its angular oscillation

** UoSAT-Oscar-9 Schedule **

The 21MHz beacon will be in use this weekend. In addition, the bulletin will run until Tuesday morning due to (yet) another public holiday in the U.K., preventing access to the ground station.

<munch munch munch>
Rather than answer all these inquiries by mail ... methinks I'll post it to the
net.
The main way to get started in ham radio is via the Novice license, which
requires (as do all ham licenses) knowledge of the Morse Code and some radio
theory and the FCC regulations pertaining to amateur radio
(International Note - What follows uses USA FCC licensing procedures as an
example - while the general concepts are probably correct, readers in other
countries should check with their government for the proper procedures)
Quite often amateur radio clubs and/or adult education classes provide Novice
courses, or you can study on your own.
The American Radio Relay League (ARRL) - 225 Main Street, Newington CT
has a series of four booklets you can buy that will tell you how to learn the
code, what to study for the theory exam, and how to set up a ham station.
```

They also provide code practice over their station, W1AW - check the most recent issue of QST magazine for times and frequencies.
You may be able to find a ham near you to help you learn the code and the theory.
The Novice license exam is given by a volunteer ham (who must have a General Class or higher license and be over 21). After you pass the code test, he/she will request the written theory test from the FCC and will give it to you when it arrives. After you take the exam, it is sent back to the FCC for grading and when you pass, they will send you your license, and you can get on the air.
As for equipment, you can build your own or buy it. The ARRL books mentioned earlier provide plans for a simple code station. If there are no stores near you, there are several reputable mail order houses you can deal with (I've heard Long's Electronics in Alabama is OK, although I haven't dealt with them personally).
By all means, get a receiver first - that way you can listen to the ham bands and to code practice on W1AW while you're studying for your license.
Don't skimp here, a good receiver is quite useful since you can't work stations you don't hear.
At this time, you should start thinking about the most important part of a ham station, a good antenna. A dipole can work well IF it is up high (great if you live near the top of a hill)_. Otherwise, look at some of the designs in the ARRL's Radio Amateur's Handbook. VERY IMPORTANT DON'T FORGET PROPER LIGHTNING PROTECTION - THE LIFE AND PROPERTY YOU SAVE MAY BE YOUR OWN.
There are lightning arrestors that one can install in coax feed lines, and also models for open wire / twin lead lines, be sure to use one and to properlyy install and GROUND it.
When you get your license, its time to get a transmitter. Its generally a good idea to get a unit that can grow with you when you upgrade to General or Advanced. Also, you may wish to get a transcever instead of a separate transmitter and receiver to save the cost of another power supply and chassis. There are some drawbacks - but those are the subject of a more advanced article
Welcome to the world of ham radio and good luck on the exam!

I have a few friends that enjoy listening to race car drivers
on their portable scanners during a race. Some of the frequencies
racers use are contained in this list (please pardon the non-auto freqs):

```
  KNEU448   461.0500    AAR Toyota Motor Sports (USA-wide)

Yesterday I was listening on 40 meters and heard a net discussing
(read that B*TCHING) about a new proposed law in Mass that had something
to do with the state trying to controll a Ham's ERP. Has anyone heard of
this? Is Mass really trying to step on the FCC again?? (They once tried
to separately license CB for use in cars! Don't snicker, if they could
have gotten away with it, how long do you think mobile Ham operations would
be safe?) Is this a fantasy or just another example of M*SSHOLE government?

TO: All Vancouver Packet Terminal Node Controller Users

From: Amateur Radio Research and Development (AMRAD)
and Terry Fox, WB4JFI

Subject: New Life for an Old Friend

The Amateur Radio Research and Development Corporation, AMRAD (originators of the now popular AX.25 Level 2 protocol) is pleased to announce that it is now possible to expand the original Vancouver Terminal Node Controller board's memory without raising an X-Acto knife! AMRAD President Terry Fox, WB4JFI has designed a daughter board that plugs into an unmodified VADCG TNC and expand the TNC memory from 4 kilobytes each of EPROM and RAM to up to 32 kilobytes of each. In addition, three software programmable timers are also provided. One timer is used to provide the clock for the 8273 (HDLC chip) on the VADCG TNC. The other two timers are used to generate timed interrupts for the VADCG TNC (8085). One timer generates maskable interrupts (INTR pin), while the other timer generates non-maskable interrupts (TRAP pin). These timers can be used to give the programmer a more accurate method of controlling protocol functions.

In addition, there are several 16 pin sockets, one 24 pin socket, and a general kludge area provided for the user. This allows for additions such as transmitter time-out timers, or modems.

EPROM Description

There are four EPROM sockets provided. The sockets are spaced so that Zero Insertion Force (ZIF) sockets can be used if frequent EPROM changing is expected. The board uses the present memory decoder chip (relocated onto the daughter board), with a jumper area used to define what type of EPROM is being used. The board comes jumpered for 2732 type EPROMs, but 2716, and 2764 types are also usable. JEDEC 28 pin socket layout is used.

RAM Description

As in the EPROM area above, the RAM sockets also conform to the 28 pin Jedec layout. The four RAM sockets will accept either 2K devices (6116 type), or 8K devices (either static or psuedo-static that are Intel 2186 compatible. The RAM address decoder is similar to the EPROM decoder, except that the jumper is set to 6116 type devices. RAM address mapping is set to begin at 8000 hex, to conform with older mods to the Vancouver TNC.

Timer Description

In addition to the new memory used on the daughter board, an Intel 8253 timer is implemented. This device has three independant software controllable timers, each with a sixteen bit divider. The old hardware baud-rate divider (CD4024) for the HDLC channel has been

moved up to the daughter board, and acts as a pre-divider to the 8253 chip. Each of the 8253 timer's clock inputs are jumperable to one of the outputs of the CD4024, allowing timed interrupts over a large variation of times. Timer 0 is now used to generate the clock for the HDLC channel. Timer 1 is normally jumpered to the 8085 trap pin on the Vancouver TNC, which is non-maskable. Timer 2 is normally jumpered to the 8085 INTR pin. The INTR pin creates an interrupt that is maskable by the CPU. The two-interrupt system allows versatile programming techniques to be used, along with better error recovery.

Daughter Board Installation

The daughter board is about 4.5 by 9 inches in size. Installation requires no wire jumpers between the two boards, and may not require any trace cutting on the Vancouver board. If timed interrupts are to be used from the daughter board timer chip, two traces must be cut on the VADCG TNC, since both the Trap and INTR pins are normally shorted to ground. NO OTHER TRACES ARE CUT!! The only other requirement is that several IC sockets on the Vancouver TNC must be capable of accepting large pins.

Connections made between the Vancouver board and the AMRAD daughter board are made through four wirewrap sockets that plug into the Vancouver board instead of the IC's that would otherwise be there. These four IC's are:

U1	8085 CPU chip
U18	2708 EPROM, upper left corner
U9	74LS138 I/O port decoder
U11	CD-4024 Baud rate divider.

All power and signals are sent between the two boards using these four sockets. It should be noted that since 2708 EPROMs are no longer being used, the minus five volt supply can be eliminated.

The first step (after making sure that the TNC board operates properly without modification) is to remove several of the Integrated Circuits from the VADCG TNC. They are:

U1	8085 CPU
U7	74LS00 Memory decoder logic.
U8	74LS138 Memory decoder.
U9	74LS138 I/O port decoder.
U11	CD-4024 Baud-rate divider.
U15-U18	2708 EPROM chips.
U19-U26	2114 RAM chips.

Now, check out the jumpers and alter them as required for the configuration required.

The next installation step is to place the daughter board over the Vancouver board so that the long wire-wrap socket pins extend into

the IC sockets U1, U9, U11, and U18. Once the pins line up properly, gently press the wire-wrap socket pins into the VADCG IC sockets. Make sure that all pins line up properly, and none are bent.

It is possible that the present IC sockets on the Vancouver TNC will not accept the larger pins of the wire-wrap sockets on the daughter board. If this happens, the IC offending sockets must be replaced in order to use the daughter board. This isn't as hard as it seems (I had to do it for the prototype board). Be careful, and use a good solder-sucker when removing the old sockets.

Now plug U1 (8085) and U9 (74LS138) into their wire-wrap sockets on the daughter board. Place some tape over U18 and U11, so no ICs are accidentally plugged into them (they are only used to gain access to certain lines on the Vancouver board).

Next, plug in the rest of the IC's and test the board out.

Parts Required

The daughter board has been designed to require a minimum of additional components, while maintaining a high degree of operation. Actually, there are only two additional support IC's required (in addition to the EPROMs and RAMs of course).

1	AMRAD Daughter Board.
1	74LS138 decoder IC.
1	Intel 8253 interval timer IC.
4	EPROMS, 2732 nominal (2716, 2764 optionally).
4	RAMs, 6116 nominal (8K parts optional).
1	40 pin wire-wrap socket.
1	24 pin wire-wrap socket.
1	16 pin wire-wrap socket.
1	14 pin wire-wrap socket.
8	28 pin solder-tail sockets.
1	24 pin solder-tail socket.
2	16 pin solder-tail sockets.
2	14 pin solder-tail sockets.
2	14 pin solder-tail sockets (optional).
2	14 pin DIP headers (optional).
1	100 UF 10 volt Electrolytic capacitor.
5	.1 UF 50 volt disc ceramic capacitors.

End of Parts List

Well, that's a brief description of the AMRAD Vancouver Daughter Board. The initial run of boards are being made now, watch for more information here, or in the AMRAD Newsletter (yes, it is still around, with a new editor, Deborah Borden). Or write to:

AMRAD, PO Drawer 6148, McLean Virginia, 22106-6148, or:

Terry Fox, WB4JFI, 1819 Anderson Rd., Falls Church VA 22043

Also, watch for a completely new set of Assembly-language code from AMRAD for the Vancouver board, AMRAD PAD (coming out soon), or most any other 8080, 8085, or Z80 based computer (including CP/M, S100, and Xerox 820 systems). NETWARE (TM) is written in modular form, similar to Ward Christensen's Computerized Bulletin Board System (CBBS)TM software, with hooks and modules coming for AX.25 Level 3 (networking).

Thank you for your time, and happy framing!!!
Terry Fox, WB4JFI

Is there a 2M repeater in Salt Lake (open access) that USENIX attendees can meet on? ... Is a meeting/party for hams planned?

And on a totally different topic ... has anyone used the TAPR board to a UNIX system ?? ... how did it work ...

It's time to upgrade my station to include Oscar 10 capability --
what equipment is recommended for Mode B? Any comments on
antennas, transceivers, etc would be appreciated. Also, is there
anyone on the net who is active in packet on the Oscar series
satellites?

Rick,

HELP!

Could anyone in New Jersey tell what frequency the Millburn, NJ police operate on. They were in the low vhf band but from the new 18" whip it looks like they moved to the high vhf band. I've been scanning the band for four days with no luck.

Also, I'm new to this new hobby of monitoring and would like to know if there are any clubs, journals, etc...

Thank You,

John Antrosiglio

hr arrl bulletin nr 40 from arrl headquarters
newington ct may 29, 1984
to all radio amateurs bt

a third party agreement was signed on may 23 permitting amateurs of the united states and of belize, prefix v3, to exchange messages on behalf of persons other than the amateurs involved. while the text has not yet reached hq, the agreement is believed to contain the usual restrictions against business traffic and against messages sufficiently important to justify using the common carrier networks. the agreement becomes effective june 22 ar

hr crrl bulletin nr 19/20 from crrl headquarters
london ont may 29, 1984
to all radio amateurs bt

doc has hinted that they will soon be proposing a major restructuring of the various classes of licence available to canadian amateurs, and that a no code entry level licence, with privileges on 50 mhz and up, may be included.

the alberta amateur radio communications service recently signed a memorandum of understanding with the alberta disaster service, the provincial emergency organization ar

hr propagation forecast bulletin nr 22 from arrl headquarters
newington ct may 27, 1984
to all radio amateurs bt

the solar flux dropped below its level at the same point in the previous solar rotation on may 21. it fell steadily through the past week, reaching 117 on may 27. this was 66 points below the april 29 peak of 183. remnants of the large sunspot groups seen in late april are coming into view again, but they appear to have faded markedly in both number and size.

coming in early summer, this quieting down of exceptionally active solar areas will not affect hf propagation severely, but similar losses next fall would cause significant changes in the hf dx picture in the direction of lower muf and longer skip on our lower dx frequencies.

conditions were generally poor in the last week, mainly the result of frequent solar flares. propagation was improving at bulletin time, but this will not last. high latitude propagation will be no better than fair may 29 through june 2, but it will improve june 3 to 5. seasonal e layer activity will be common on 28 and 50 mhz, and the likelihood of 144 mhz e skip will improve during june ar

Subject: list of English language rtty press stations
Message-ID: <9556@mgweed.UUCP>
Date: Thu, 31-May-84 09:30:59 EDT
Article-I.D.: mgweed.9556
Posted: Thu May 31 09:30:59 1984
Date-Received: Sat, 2-Jun-84 10:47:12 EDT
Organization: AT&T Consumer Products - Montgomery Illinois
Lines: 330

The following is a list of frequencies where English language press stations can be found on HF. This list is from personal monitoring over the last 10 years and is not copied from any other lists.

These press stations all transmit in English, some all the time, others just occasionally.

The "SB" column indicates USB or LSB to be selected for normal copy. The apostrophe next to the L or U indicates that the station is still on the air as of the last 12 months. (I don't drop any from the list unless I am sure they are no longer on).

The "SH" column indicates the shift (Mark to Space frequency difference) used. Note that most use 425Hz shift.

The "BD" column indicates the baud rate, not words per minute. This is standard Baudot rtty code. Most foreign stations use "FIGS J" as the bell and "FIGS S" as apostrophe, which is the reverse of American machines.

The "M" in the "BD" column indicates that the station is a frequency division multiplex transmission, usually with 16 subcarriers. The shift is usually 85 Hz and many terminal units will not copy this. Receiving these fdm stations with the bfo off sounds like a buzz-saw. These stations are the best source of AP/UPI news, quite similar in format to the wire line press service sent to radio stations. The best way to tune these in is to select USB, tune onto the station from the high frequency side to the upper-most subcarrier. This subcarrier is usually the one carrying the news.

The "SVC" column shows the abbreviation of the news service.

The "CALL" column is obvious. Not all stations give identify with a call sign. Some use the same call sign on all frequencies at once, and some have calls for each frequency in use, but do not indicate which call is for which transmitter.

Not all stations of a particular service carry the same text. The VOA, for example carries as many as 4 different "programs" at the same

time. the ARF, however, has the same text on all 4 frequencies at once.

I have not given times of transmissions. That is too difficult to pin down accurately. Many stations are on continuously.

The frequencies given are within 2 kHz. Some stations do slide up or down a little, reverse their mark and space frequencies on occasion, and my receiver readout does not include the amount of bfo offset (about 1.5 kHz).

Later this year, when the list is updated, I will send the complete HF rtty list, including utility stations (weather, military, embassy, etc).

Happy tuning de K9EUI

Be sure to see the article "Low Cost Space Projects: Part 1" in the April 1984 issue of the L-5 News on page 3. This is an excellent discussion of AMSAT's activities in satellite construction. Is the author (Bill Ganoe, N7EAB) out there somewhere? I'd like to personally thank him.

73, Phil Karn, KA9Q
Asst VP Engineering, AMSAT

I'm going to be buying a 2M hand-held within the month. I am
seriously considering a Santec ST-142, Lew McCoy reviewed it
in this month's CQ, and had nothing but praise for it. I am
wondering if any of you out there have any experience with one?
Also, would it be better to get a Icom IC-02 instead, or even
a Kenwood or Yaesu model? The Santec seems to have the most
features at a lower price than anyone else. Also, anyone
know where the best place to buy one via mail order is?

Thanks,
Milo Medin

Does anyone have a listing of the freq's used by the major airlines for air-to-ground communications for their respective companies??

Also, I would appreciate ANY freq's given (towers, control, approach, departure, ground, etc).

Thanks in Advance

We in AMSAT have recently been revamping the way we handle offers of volunteer help. Up 'till now, it has been a very informal thing, but we are coming to realize that a lot of excellent talent has slipped through the cracks because we haven't provided a central point of contact for initial inquiries.

Dick Jansson, WD4FAB, has taken on the job of coordinating volunteer services. He and I have drafted a form letter which he will send to anyone who expresses interest. This letter contains a list of the various project areas and the AMSAT people who are active in them. If you are interested in possibly helping out, please drop Dick a line. His address is:

Dick Jansson, WD4FAB
1130 Willowbrook Trail
Maitland, FL 32751

You can also reach him through the Washington PO Box address, but it takes
longer since the mail has to be forwarded.

Thanks & 73,
Phil Karn, KA9Q

To: All packet stations
From: Hank Magnuski, KA6M
Subject: Sao Paulo Packets

Am pleased to report the reception of packet radio transmissions from
Sao Paulo, Brazil. On June 2nd, at approximately 0800 UTC, PY2BJO,
"Junior", was heard testing on the Oscar 10 digital channel. Using
a TAPR TNC, his signal was heard well, but I was unable to connect as
he was having difficulties tuning in and I think his receive margin was
small.

This is the first South American packet station that I am aware of.

73, Hank

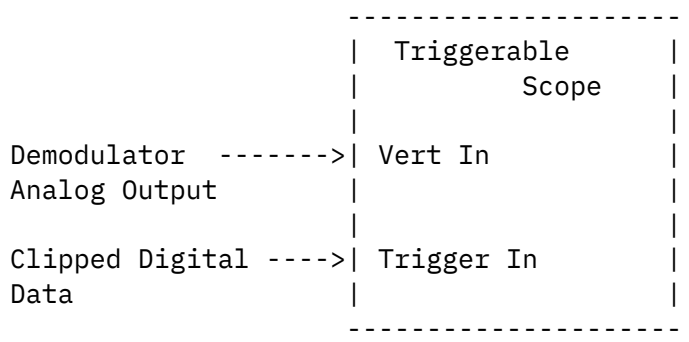
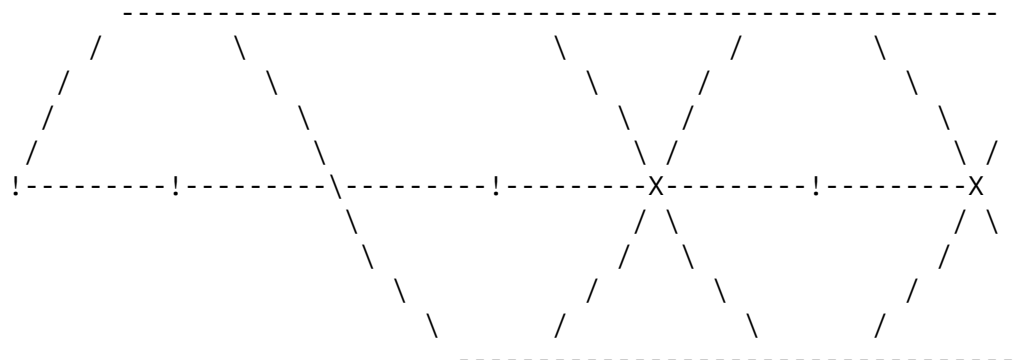
To: All packet stations
From: Tom Clark, W3IWI
Subject: Eye Patterns for packet radio testing
Date: 03 June 1984

I have been asked to explain a little more about eye-patterns for
testing the performance of demodulators. In my original note on the
FT726 performance I recommended the following setup:



The analog output from the demod should be taken off at the last point in the demod that the signal is still analog -- i.e. just before the clipper that converts it into digital format. On the TAPR TNC, this analog output is available on the XR2211 on pin 8. Similar points exist in commercial demods. The digital data should be the digital signal you are actually going to feed into your UART or your HDLC chip. On the TAPR TNC, use the pull-up resistor on pin 27 of the 1933 as a tap. (I am not referencing the test points and/or header pins on TAPR since the Beta and Kit versions have different designators).

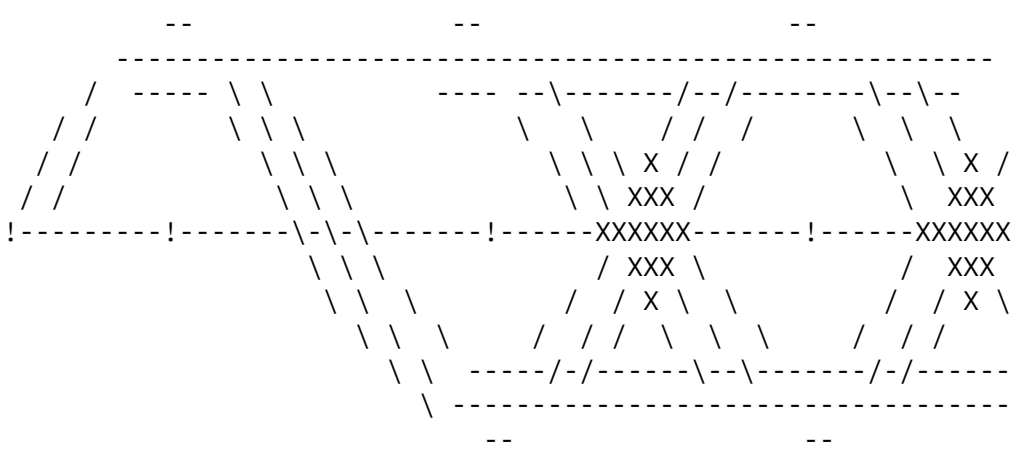
The decision on whether the analog signal is a 0 or a 1 is made in some sort of clipper thresholding device. This is in the 2211 on TAPR, it is often done in a 741 or 339 in other modems. This clipper is pretty dumb -- it only knows up and down. To make its life easiest, it wants to see a clean analog signal. The eye-pattern is the easiest way to test what type of signal it is being given. The following is a "perfect" eye-pattern (pardon the computer graphics!), assuming you are triggering on the + going edge :



The "eyes" are open, zero crossings are clean and repeatable. The first "eye" (or loop) has only a single loop since you triggered on the + going edge. For all succesive loops, the typical data stream as some cases when adjacent data bits are the same and some cases when they are different. When adjusting you modem, note that the DC level represented by the vertical position on the scope can be used to make the zero-crossings (denoted by X's) occur at the same voltage level as the clipper's 0/1 threshold. This is the best way to set a modem on

frequency. This is the trick I use for tuning in FSK packets on AO-10.

Now let us look at a poorer eye-pattern. Bad conditions include jitter in the zero-crossing times, un-equal amplitudes for the case of two adjacent data bits being the same vs. different, etc. The following might represent a very marginal demod:



Look for "droop" in the horizontal lines (horizontal lines connecting two "eyes" occur because of identical adjacent bits); such droop could be indicative of low-frequency response inadequacies in the demod. Un-equal amplitudes between single loops and multi-bit loops is usually a sign of amplitude imbalance between low and high tones or reflects bad predection filter values. Jitter in zero-crossing times combined with large amplitude excursions is often a sign of bad group-delay equal-ization in the modem or the radio. You also want to see "open eyes" with no zero crossing at the mid-bit time. Of course, on weak signals with lots of noise, you can expect to see more jitter. When you start seeing transitions in the middle of the eyes, the signal is too weak to get a good bit error rate.

I'd suggest that those of you trying these tests first look at the strong packet signals on a local FM channel. They should approach the "perfect" picture above. As the signal gets noisier, you will see the Bit Error Rate performance degrade.

When I reported on the FT726 originally, the eye patterns I observed were even worse than that depicted above -- in fact the eyes were not "open" and the pattern was not discernable. With the new filter I reported on about a week ago, the eye-patterns are acceptably "open". It is hard to describe this behavior quantitatively, but after you have looked at a few cases, it becomes obvious.

Hope this treatise helps. Keep me informed on what you find. 73, Tom

For info -- the AMSAT/APL packet repeater in Maryland is now signing the call W3VD-5 on 145.01 running 25 watts. Reports from MD/DC users indicate very good coverage over a 30-50 mile radius.

For about 6 weeks beginning June 12, I must be in Fairbanks, AK on business. For those of you curious about why -- at NASA I direct the effort withing the Crustal Dynamics Project which inter-connects radio telescopes aroud the world using the technique known as Very Long Base-line interferometry. With VLBI, we are able to measure the distances between stations separated thousands of km to accuracies of 1-2 cm -- making this the most precise surveying technique available. This summer we are adding four new base stations to our network to measure the motions of the Pacific plate -- thought to be about 8 cm/yr. The new stations are in Alaska, Hawaii, Kwajalein and Canada. In addition, we will have two mobile VLBI stations running around Alaska and Canada to measure regional deformations in areas where earthquakes are likely to happen soon. Since Fairbanks is the "hub" of this global program for the summer, it is necessary for me to be there to direct a rather massive technical and logistics operation.

During the time I am in Fairbanks, I will be house-sitting for KL7GNG who lives only a few miles from the 26 meter antenna we will be using. Tom Walyer has an excellent station equipped for AO-10 on both mode-B and -L, for packets, and for HF. So expect to hear me on the air. In addition, the KL7RA QTH reknown for its contest performance on HF is on the site of the Fairbanks station, so I may be operating from there too.

Elizabeth plans to join me for about one week near the end of my sojurn. I should return home about July 22, too late for the ARRL national convention, but just in time to zip off to the Central States VHF Society meeting in Cedar Rapids.

During the time I am away, I will also be in contact with y'all on the air and via TeleMail. However, my remoteness and a very busy schedule will make it very difficult to attend to the day-to-day business of AMSAT. Therefore, I am asking AMSAT's second-in-command, Vern Riportella (WA2LQQ), to oversee the operations of the organization during my absence. I am sure that you will give Rip your full cooperation.

73,Tom

First HT-to-HT QSO Scored Thru OSCAR 10

An important milestone was reached May 28th when amateurs in West Virginia and California apparently became the first ever to QSO using handheld transceivers (HT) through an amateur radio satellite. KD6DDQ in Los Angeles and KD8GL in Wheeling, WV, each using only a 2-m FM HT first established contact at 1458 UTC. The historic event was facilitated by so-called "gateway" stations which served to connect local terrestrial repeater systems to the high-flying AMSAT OSCAR 10 (AO-10) satellite. Although in the past CW QSOs have been reported where one of the stations keyed the transmit

switch of his HT for a crude key, it is believed the May 28th QSO comprised the first occasion on which both QSO participants used HTs.

In West Virginia, KD8GL used his 2-m HT to talk through the Triple States Radio Amateur Club repeater, KD8GL/R. Signals from the repeater were picked up by the local gateway station WB8ZTV which converted them from FM to SSB while converting them to the 435 MHz OSCAR 10 uplink frequency. Signals were then beamed by WB8ZTV to OSCAR 10 positioned high over the Western Hemisphere.

Meanwhile in L.A., gateway station N6JFD tuned to the AO-10 downlink and converted the SSB back to FM and forwarded the signals to the WA6OBT repeater to which KD6DDQ was tuned. The reverse path to Wheeling was the mirror image of this path. Both repeaters and gateway stations operated full duplex and the QSOs were two-way. Signals in both directions were excellent according to monitors.

Later, the W7LWE repeater/gateway in Lake Havasu City, AZ joined in the fun. This made it the first three-way gateway operation and effectively linked amateurs in three states using OSCAR 10's trunking capabilities.

According to an AMSAT official, "This historic event marks the vanguard of easy-access satellite communications for utility use by minimally equipped amateurs."

Particpating in the May 28th linkups also were KR3V, K8AN, K2QWD, N6IAW, W7MCF and numerous others.

Further dramatizing the significance of gateway operations, an event on the preceding day, May 27, vividly showed another aspect of the new, long duration coverage OSCAR: endurance. On May 27th the Wheeling gateway was linked to expert satellite station ZL1AOX in Christchurch, New Zealand for three hours continuously.

AMSAT is suggesting that demonstrations of satellite communications by using gateway interconnects may be just the vehicle to exhibit the new OSCAR 10 capabilities while reducing new-user costs to zero. According to AMSAT's WA2LQQ, "Nothing can beat the flexibility of your own OSCAR station, but for those just starting out, this seems a good way to taste the wine before one buys the bottle!"

A free information kit is available from AMSAT (for an SASE) at P.O. Box 27, Dept GW, Washington D.C. 20044.

The following is offered as a symbol of a potentially fertile area.

First HT-to-HT QSO Scored Thru OSCAR 10

An important milestone was reached May 28th when amateurs in West Virginia and California apparently became the first ever to QSO using handheld transceivers (HT) through an amateur radio satellite. KD6DDQ in Los Angeles and KD8GL in Wheeling, WV, each using only a 2-m FM HT first established contact at 1458 UTC. The historic event was facilitated by so-called "gateway" stations which served to connect local terrestrial repeater systems to the high-flying AMSAT OSCAR 10 (AO-10) satellite. Although in the past CW QSOs have been reported where one of the stations keyed the transmit switch of his HT for a crude key, it is believed the May 28th QSO comprised the first occasion on which both QSO participants used HTs.

In West Virginia, KD8GL used his 2-m HT to talk through the Triple States Radio Amateur Club repeater, KD8GL/R. Signals from the repeater were picked up by the local gateway station WB8ZTV which converted them from FM to SSB while converting them to the 435 MHz OSCAR 10 uplink frequency. Signals were then beamed by WB8ZTV to OSCAR 10 positioned high over the Western Hemisphere.

Meanwhile in L.A., gateway station N6JFD tuned to the AO-10 downlink and converted the SSB back to FM and forwarded the signals to the WA6OBT repeater to which KD6DDQ was tuned. The reverse path to Wheeling was the mirror image of this path. Both repeaters and gateway stations operated full duplex and the QSOs were two-way. Signals in both directions were excellent according to monitors.

Later, the W7LWE repeater/gateway in Lake Havasu City, AZ joined in the fun. This made it the first three-way gateway operation and effectively linked amateurs in three states using OSCAR 10's trunking capabilities.

According to an AMSAT official, "This historic event marks the vanguard of easy-access satellite communications for utility use by minimally

equipped amateurs."

Particpating in the May 28th linkups also were KR3V, K8AN, K2QWD, N6IAW, W7MCF and numerous others.

Further dramatizing the significance of gateway operations, an event on the preceding day, May 27, vividly showed another aspect of the new, long duration coverage OSCAR: endurance. On May 27th the Wheeling gateway was linked to expert satellite station ZL1AOX in Christchurch, New Zealand for three hours continuously.

AMSAT is suggesting that demonstrations of satellite communications by using gateway interconnects may be just the vehicle to exhibit the new OSCAR 10 capabilities while reducing new-user costs to zero. According to AMSAT's WA2LQQ, "Nothing can beat the flexibility of your own OSCAR station, but for those just starting out, this seems a good way to taste the wine before one buys the bottle!"

A free information kit is available from AMSAT (for an SASE) at P.O. Box 27, Dept GW, Washington D.C. 20044.

Everyone should be sure to see the article on page 41 of the new (April)
QST, entitled "Artificial Radio Aurora: The Sequel". The subtitle reads:
"Based on previous experiments, the authors deduced, contacts should be
possible via the RF energy produced from the massive competition
to work the Space Shuttle Columbia. Despite early setbacks, their
results exceeded their wildest expectations."

73, Phil

If you have gotten the power connected to your 820 and hooked up
a video monitor to the HS VS and VO pins on J7, you may have no-
ticed that only the left half of the screen shows, and the right
half seems to run off the right edge of the screen. You are not
alone. I got my board up a couple of days ago, and I thought
that the problem was caused by the circuitry that I was using to
get composite video. After a couple of hours of dedicated (?)
work with an oscilliscope here at the computer lab, ace video
wizard Ralph Droms found that the horizontal sync signal that is
available at J7 was much too long. Somewhere between J7 and where
it is generated, the signal gets perverted, and it kills half of
the screen.   Ralph located a more reasonable signal to use for

the HS, and it works beautifully. To use this new and improved HS signal, forget about pin 4 on J7 and use pin 8 on U34 instead.

We found this error on both of our boards, so there is a good chance that it is on all of them. Please let me know if this is the case.

Happy Video!

Overall there is a smell of fried onions. (fnord)

I am looking for the names of suppliers or manufacturers of magnetic card (plastic cards like credit cards with a magnetic strip on back) equipment. This equipment includes the basic card readers and the card programmers. Also needed are the names of suppliers of the custom or generic cards.

The application for this equipment is for controlled access to a building, so any and all other information about using this type of equipment would be welcomed.

Please respond in any manner available; email, phone,

U.S. Mail, or to this net. Thanks in advance.

Based on information I believe orginated in this network newsletter, I recently purchased a copy of the Xerox 820 CPU board. No documentation was supplied with the board, and finding someone at Xerox who knows where/how I might find such documentation has been difficult.

Since the information I recieved mentioned that a ham group (in Little Rock?) had some success in bringing the boards up, I am hoping that someone has copies of Xerox technical documentation (hard- and software) for this board, and hoping even more that a CP/M 2.2 BIOS is available (on 8" single density...?). If anyone has such information, or knows how to get it, I'd greatly appreciate any/all assistance.

From: MSWEETING
To: AMSAT
Subj: Uo-11 status
  ** UOSAT-2 Status Report **   Jodrell Bank 1725 30th March

    I have spent the last few days up here at Jodrell Bank
Radio Telescope on the 85 foot antenna with a crossed-dipole
feed on 145 MHz listening for anything emanating from UOSAT-2,
both within a narrow 2.5 kHz bandwidth and +- 100 kHz
wideband. The receiver & antenna system have been checked
using UOSAT-1, the sun and Cassiopia and appear to be
performing well. We have got probably the best UOSAT-1 data we
are ever likely to see! The UOSAT-1 signal was peaking +75 dB
above the minimum discernable signal level here, so I feel
that we should be able to hear something if UOSAT-2 is
radiating anything on the nominal frequency. The wideband
signal performance is about 20 to 30 dB worse.
    We also tracked OSCAR-10 and received good signal from out

at 42,000 km with the 145.810 MHz beacon peaking at +55 dB above noise - the passband noise was also detectable at some 10 - 15 dB above the rx noise. Some good ssb signals were also copied.

We have tracked UOSAT-2 last Thursday evening & Friday morning passes without anything detected at all that can be relied on - there were two bursts of carrier on the noise level, each of about 10 seconds duration, but these could not be identified positively and were most probably from other amateur activities.

We shall continue with further tests on tonight's pass (Friday) and, unless antthing interesting is heard, shall then head home to Surrey and have a council of war. We do have access to this facility until Thursday next week.

Roger & Neville have remained at Surrey to carry out command functions whilst the listening tests are carried out at Jodrell.

Well, now to think of the next theory!

Whatever they're tracking is certainly consistent; AOS predicts between sets 15 and 16 are 110 milliseconds apart, and the straight-line distance between the two predicted positions varies between 1 and 2 km.

All,

 !!! IMPORTANT !!!

TAPR has recently received reports of field failures of the 7.3728 MHz
oscillator on the TNC. The symptoms are improper reset of failed
operation.

Careful analysis of the problem indicated that the oscillator U1A, U1F,
X1 and assocaited components on the kit board, would free-run at 22 to
49 MHz.

The problem has been duplicated and confirmed here in Tucson. There is
a fix, however!

It appears that the fairchild 74LS14 ICs shipped in kits starting about
January may exhibit this symptom, sometimes when cold and starting up, other
times when warm. The cure is usually just a power off/on cycle or two. This
is not a fix, however...

We used several Fairchild Hitachi anf National parts as well as the Signetics
74LS14s that are scheduled for the next 1200 or so kits. The Fairchild
parts are the most susceptible to this fault, but the others may do it
as well.

The fix is as follows:

1) Replace R12 (1.5 k) with a 1k 5% carbon film resistor.

2) Replace R13 (1.5k) with a 1k 5% carbon film resistor.

3) Add a 20 or 22 pf ceramic disc capacitor at location Cy (previously
unused).

With the above mods, all Signetics, hitachi and National parts tested

performed flawlessly at hi and low Vcc, and at superhot (can't touch it) through very cold (lots of ice condensed on the part in the dry Arizona climate) temperatures. All but one Fairchild part worked under the same conditions, and the one that didn't simply had excessive frequency drift (about 50 kHz - waveform still clean, but may have drifted out of crystal-controlled lock).

If the unit is still malfunctioning in this area (unlikely), replace the 74LS14 with a non-Fairchild part.

All kits shipped after this date (6 April 1984) will have the proper parts along with an errata sheet describing the fix.

PLEASE SPREAD THE WORD OF THE PROBLEM AND THE FIX AS WIDELY AS POSSIBLE IN YOUR LOCAL PACKET AREAS!

A secondary benefit may be a reduction in the rate of NOVRAM "forgetting" symptoms -- this hasn't been confirmed, however. Feedback in this area would be appreciated. Some oscillators before the mod had the symptom of starting at a very high frequency, then locking to the crystal after a few hundred milliseconds, often requiring a toggle on the RESET switch to bring the TNC up.

Thank you for your assistance in spreading the word...

Lyle

Once again, the Goddard Amateur Radio Club will be rebroadcasting the Space Shuttle's ground-to-air voice transmissions. The operating schedule is as follows:

Frequencey	Times
3860 KHZ	0700 -> 1300 UTC
7185 KHZ	1300 -> 2200 UTC
14295 KHZ	0700 -> 2200 UTC
21390 KHZ	as band conditions permit
147.45 MHZ (FM)	0700 -> 2200 UTC (Washington DC - Baltimore MD area)

The station, WA3NAN will operate from 0700 UTC (2 AM EST) until 2200 UTC (5 PM EST), except during the crew's sleep periods. The station is located at the Goddard Space Flight Center, in Greenbelt, Maryland. This is about 10 miles or so north of Washington DC.

It's a great change from the sporadic and cursory coverage that the television news media provides. Three cheers for the guys at WA3NAN providing this service to the amateur community. Of course anyone with a shortwave radio or programmable police scanner are welcome to listen too!

NABER INITIATES TECHNICIAN CERTIFICATION PROGRAM,
CURRENT FCC LICENSE HOLDERS TO BE GRANDFATHERED

This information from the National Association of Business and Educational Radio (NABER) will be of interest to holders of FCC Commercial Radiotelephone Operators Licenses:

"The FCC voted in its February 24, 1984, meeting

to
eliminate the license requirement for technicians installing, repairing, and maintaining radio transmitters in the Private Land Mobile, Fixed, and Personal Radio Services (General Docket 83-322). The FCC's Field Operations Bureau, however, did state that the Commission now 'strongly endorses and encourages' the establishment of a program or programs to ensure that maintenance, installation, and repair are performed only by certified technicians."

"....This is why NABER has developed a Technician Certification Program."

"....NABER is presently offering an Exemption Program for Charter Participants which will allow those persons who currently hold a valid General Radiotelephone Operator, First-Class, or Second-Class License to be 'grandfathered' into the NABER Technician Certification Program with a waiver of the examination requirement. The deadline for the Exemption Program is Aril 30, 1983...." (now July 30, 1984 - bp.)

There is a $10 fee, which will help to cover the certificate printing (with a calligraphied name) and verification card. More information and an application form are available from:

NABER
1330 New Hampshire Ave. NW
P.O. Box 19164
Washington, DC 20036

tel (202)887-0920

I'm not endorsing this program, but I mailed in my check for $10 today.

Is there any way that us folks without a radio might be able to hear these
rebroadcasts? Can a tape be made?

Would one of you bright guys into ham radio suggest something please. Thanks.

qst de k9eui
hr crrl bulletin nr 12 from crrl headquarters
london ont april 5. 1984
to all radio amateurs bt

crrl has made several important requests of doc, 1, that doc remove all operating restrictions on the 160 metre band now that loran a has ceased, 2, that doc reinstate rtty privileges on 7050 to 7100 khz and delete the requirement to identify on cw or voice after rtty transmissions, 3, that doc allow specific amateurs to conduct low power tests on the 18 and 24.5 mhz bands, 4, that doc limit punctuation on code tests to period, question mark, comma, slant bar and double dash and q signals to those in common use, and, 5, that doc allow a few days grace, as required, for those wishing to write an advanced amateur exam one year after writing an amateur exam and for those wishing to use credits obtained one year ago on an amateur or digital amateur exam.   regulations changes, announced two years ago, having to do with reciprocal operating on 2 metres, repeaters on 10 metres and additional privileges on 160 metres are still stalled at the privy council office ar

qst de k9eui
hr propagation forecast bulletin nr 15 from arrl headquarters
newington ct april 8, 1984
to all radio amateurs bt

sunspot numbers and the solar flux have been falling steadily since the end of march. the visible portion of the sun was almost devoid of spots at bulletin time. the solar flux was down to 101, and it is expected to drop further in the next few days. these conditions will make for lower f layer muf than would normally occur at this season. seasonal and solar effects will be most noticeable on 21 and 28 mhz. skip will be poorer on all frequencies, and the number of useable hours per day will go down.

the good side of this picture is that, with a quieter sun, the quality and strength of signals will improve, though the useful day is shorter. geomagnetic activity was above normal much of the time recently, and conditions tended to be below normal on all frequencies. we are also moving into the season for sporadic e propagation, which enlivens the 28 and 50 mhz bands at this time of year. characteristics to be expected are very high signal levels at times, but with frequent changes in skip distance and direction. there have been phenomenal e skip sessions on 50 mhz, and linkages of this mode with the seasonal transequatorial propagation have provided exciting 50 mhz dx. in the southern part of the country, 50 mhz was active nearly every day since the middle of march. on april 5 and 6 new zealand, australia and several small pacific islands were worked on 50 mhz from most u.s. call areas. obviously, the transequatorial mode does not require high solar flux levels. watch for it in the afternoon hours on days when the wwv k index is 3 or higher.

american sunspot numbers for march 29 through april 4 were between 63 and 118 with a mean of 89.1 ar

From Larry Kayser
Re Xerox 820 boards
I have been sort of tracking the 820 news and since one of these boards is due here soon I would like to determine some details so that we might make reasonably prompt use of the 820.

Specific Questions
-Does anyone have a complete assembler listing for the 820 BIOS? (I understand the BIOS is in two parts, disk for 6 sectors and EPROM as well)
-Has anyone brought up BYE running beneath the CCP, that is lower in the memory space?
-Has anyone brought up ZCPR2 on the 820?
-Has anyone brought up SIGNON on the 820?
-Has anyone brought up a Western Digital 1001 hard disk controller on an 820?
-Has anyone done a simple modification for double density?
-Has anyone added a large RAM capability to emulate a disk drive?

My specific interest is to use the 820 in a gateway to replace an old 8080 system. Any help will be appreciated.
Regards, Larry Kayser

Amateur Radio rules prohibit broadcasting or rebroadcasting.
A blanket waiver has been granted by the FCC to cover shuttle flights (any ham may retransmit shuttle communications if they get NASA's permission first). However, I am afraid that taping them and redistributing them would be a violation.

Some time ago, someone posted the orbital elements for the various
amateur satellites, not the ones for Karn's software, but the ones
used with the various BASIC programs that exist, such as those from
AMSAT. I would appreciate if someone could send me a copy or repost
this info!

Here's a collection of the latest NASA keplerian elements I have for the
various interesting satellites. These can be used either with my
programs or with the W3IWI program versions available from AMSAT. These

can NOT be used with simple equator-crossing predictors, but since the
W3IWI program can be run even on the lowly ZX-81, there isn't much
excuse for still running obsolete code!

Phil

It works!! We succeded in getting CP/M 2.0 up on one of the boards the
other night, so now it is official--it *is* possible. I wrote a boot
program and the CBIOS section and well, it works. The code still needs
some work to make it bulletproof, though. Most of the functions map right
over to the Xerox monitor ROM entry points with a bit of shuffling. There
are some little things that need to be changed (CP/M sends characters in the
C register to be output, and Xerox wants them in the A register...) but nothing
too difficult.

Some updates and hints:

In a previous article I mentioned that the monitor command 'B' also boots
the system. It does, but it boots from disk 01 instead of disk 00 like the
'A' command does. If your boot program (like mine) assumes that the system
will be cold-booted from drive 00, make sure you use the 'A' command to boot
the system.

I just got this update on the 'undocumented' monitor entry points:

****

Subject: Re: Xerox 820 REVEALED#2--Monitor Jump Tables

I hope I can fill in some of the blanks. This info is from the 820
Software Development guide. I have not tested any of them. For those
that were short and
clear I typed the actual code listing with comments verbatim.

F033 SPACE   Print a space
         In : ??
         Out: ??

Hope this helps.

Brian
*************************************************************************

Thanks again.

The connections we used for the disk drive (SA800/801) are:
```

Xerox	Floppy	Name
01	NC	-
02	NC	-
03	NC	-
04	20	Index
05	26	Drive Select 1
06	28	Drive Select 2
07	NC	-
08	18	Head Load
09	34	Direction Select
10	36	Step
11	38	Write Data
12	40	Write Gate
13	42	Track 00
14	44	Write Protect
15	46	Read Data
16	NC	-
17	22	Ready
18	NC	-
19	NC	-
20-37	11-49(odd)	GND

We are using a separate power supply for the disk, so no power connections were made from the board to the floppy.

If you are looking for a cheap way to connect to J7, try cutting an IC socket in half. I used an 8 pin socket, cut it in half, trimmed it a little, and hooked up 3 leads to it. On the two boards here, the HS signal at J7 is garbage, so the eventual fix will be to cut the PC trace, and run a wire from U34 pin 8 to J7. (Has anyone else had this problem?)

Mail and news got screwed up here last week because of a major filesystem crash, so if you sent me something and I haven't replied, try me again.
I'd really like to hear if anyone else is making progress on these things.

Overall there is a smell of fried onions. (fnord)

So I don't have to ask again. Are there a standard set of amatuer
radio (non-amateur???) frequencies that are used to rebroadcast
the air (space) to ground communications? Are these same freqs.
used for every shot???

MOVING SALE

The following items, mostly of interest to ham radio operators,
is in excellent condition (if it don't work right, I'll buy it
back). I'm moving, and just don't have room for this. If it
doesn't get sold, it will either go in storage or get trashed.

Kenwood MC-50 desk mike
Heathkit HM-102 SWR/Power meter
Heathkit Electronic keyer

Palomar Engineers 1.8-54 MHz pre-amp (this thing works GREAT!)
Johnson Kilowatt Matchbox (mint condition, paint has even been waxed!)
Ringo Ranger 2-meter base antenna
Heathkit speaker (matches old SB-600 line)
Hitachi AM car radio (from 1978 Honda Civic)

Make me an offer on any or all of the above items. No reasonable
offer refused. I can UPS for out-of-towners.

qst de k9eui
hr dx bulletin nr 15 from arrl headquarters
newington ct april 12, 1984
to all radio amateurs bt

(note: some areas of the text are (questionable) due to
thunderstorm during bulletin time).

thanks to w1trc, k1mm, k1xm and the southern new england dx
association for the following dx information.

taiwan. pa0gam, sm0gmg and oh2bh have been granted permission
to operate from taipei for seven days, beginning april 17. the
authorization includes 80 and 40 meters for the first time
ever. two stations will be operating simultaneously, and the
callsign will be announced at the beginning of the operation.
qsl to oh2bh. there is a possibility of a side trip to cr9,
macao.

aland islands. oh1cn, oh1eb and oh1eh will operate oh0am on 10 through 80 meter ssb and cw april 19 to 23. they will go out of their way to meet (garble copy) mode requests. qsl to oh2bh.

africa. w4lzz will be traveling in africa and hopes to get permission to operate from angola, d2 and mozambique, c9.

comoros. d68am should be on tomorrow night at 2345z on 14235 khz.

franz josef land. uw3sy/1 was on last night on 14025 khz at 0115z.

seychelles. rudy, 5n3rtf, is going to the seychelles and hopes to operate s79m or (s79wwn?), beginning april (17?).

ascension island. zd8rc is on (213?5) khz around 2230 to 2300z.

ivory coast. special calls tu71, tu72 and tu73 will be operating through april and may. all three have been worked around 14225 khz at 2315z. qsls for tu71 and tu73 go via ak3f.

brunei. vs5hg has been on 14198 khz at 1400z.

swaziland. 3d6al has been on regularly on 14205 khz at 1300z, long path.

the gambia. c53al can sometimes be found on 7230 khz at 0800z.

corsica. look for special call tk5el on 14235 khz at 2330z.

senegal. another new call, 6v1a, appears on 14192 khz at 2045z.

san marino. t77c has been on 14220 khz around 2200z.

indonesia. john, yb5aso, has been worked on 7005 khz at 0000z.

american samoa. watch for wh8aaj on 14280 khz at 1250z ar

The current ARRL DXCC country list follows. The colon-separated
fields are:

1. primary prefix
2. country
3. continent
4. ITU zone(s)
5. CQ zone(s)
6. other prefixes, if any

For my own use, I added a first field containing a symbol
for status (- for worked, # for QSL received, etc.).
Using programs such as sort, awk and grep, one can use the file

for printing lists by prefix, country name, continent, etc.
Please send corrections and suggestions to me.

qst de k9eui
hr propagation forecast bulletin nr 16 from arrl headquarters newington ct april 16, 1984
to all radio amateurs bt

the solar flux was down to 94 on april 9, its lowest level since early january. the curve turned downward on the 11th, and the flux was back to 119 on the 15th. the curve was leveling off at that point and another gradual decline is expected by the middle of the forecast week. the earths magnetic field was less active, so propagation actually improved overall despite the flux decline.

propagation is expected to be fair to good through the 16th. thereafter, there will be frequent periods of high geomagnetic activity, with possible auroral effeqts in the northern states and canada. high latitude paths will be poor, especially on 21 and 28 mhz, but low latitude circuits will be only mildly affected. transequatorial dx activity on 50 mhz will taper off from its high level of april but it will not disappear entirely this month.

sporadic e layer ionization is increasing but the major season for this mode is still several weeks away. its principal effeqt is short skip, occasionally with very high signal levels, on 28 and 50 mhz. later in the spring the number and

extent of openings will increase, and e skip on 144 mhz will become more likely.

american sunspot numbers for april 5 through 11 were between 1 and 60 with a mean of 28.9 ar

qst de k9eui
dx bulletin nr 15 from arrl headquarters newington ct
april 12 1984 to all radio amateurs

thanks to w1trc, k1mm, k1xm and the southern new england dx association for the following dx information.

taiwan. pa0gam, sm0gmg and oh2bh have been granted permission to operate from taipei for seven days, beginning april 17. the authorization includes 80 and 40 meters for the first time ever. two stations will be operating simultaneously, and the callsign will be announced at the beginning of the operation. qsl to oh2bh. there is a possibility of a side trip to cr9, macao.

aland islands. oh1cn, oh1eb and oh1eh wpll operate oh0am on 10 through 80 meter ssb and cw april 19 to 23. they will go out of their way to meet your band and mode requests. qsl to oh2bh.

africa. w4lzz will be traveling in africa and hopes to get permission to operate from angola, d2, and mozambique, c9.

comoros. d68am should be on tomorrow night at 2345z on 14235 khz.

franz josef land. uw3sy/1 was on last night on 14025 khz at 0115z.

seychelles. rudy, 5n3rtf, is going to the seychelles and hopes to operate s79mc or s79whw, beginning april 27.

ascension island. zd8rc is on 21345 khz around 2230 to 2300z.

ivory coast. special calls tu71, tu72 and tu73 will be operating through april and may. all three have been worked around 14225 khz at 2315z. qsls for tu71 and tu73 go via ak3f.

brunei. vs5hg has been on 14198 khz at 1400z.

swaziland. 3d6al has been on regularly on 14205 khz at 1300z, long path.

the gambia. c53al can sometimes be found on 7230 khz at 0800z.

corsica. look for special call tk5el on 14235 khz at 2330z.

senegal. another new call, 6v1a, appears on 14192 khz at 2045z.

san marino. t77c has been on 14220 khz around 2200z.

indonesia. john, yb5aso, has been worked on 7005 khz at 0000z.

american samoa. watch for wh8aaj on 14280 khz at 1250z.

I have cards from the Cooks but don't

know if it's North or South; for the purpose of DXCC. I think Manihiki is North and Raratonga is South, but am not sure. Can anybody set me straight on this??

Having been basically off the air for the last two years, this may
be a bit dated, but here are my two big suggestions for 20.

1] The portion from 14.175 to 14.250 is DX. Avoid rag-chewing
    down there.

2] Watch out for the Maritime Mobile net at 14.303 (?? help on
    freq. anyone). They are a bit over protective and tend to
    have delusions of grandeur, but they do serve a VERY usefull
    and important purpose.

Hope this helps, I think it is worth posting for all to see, since
this sourt of question should get asked much more frequently than
it does.

Are there any other BCB DX'ers on the net? (For those who don't know what it is, BCB DXing is listening for distant AM Broadcast Band stations.) I'd be interested in exchanging mail about all aspects of the hobby, and trade tips etc.

As another issue, does anyone have an Icom R70 or R71-A? I am probably going to get the R71-A soon (and an amateur transmitter when I get to a better QTH).

I have been seeing ads and brochures for this general-coverage digital receiver for a while now. It seems to be exactly what I want: something that my computer can turn on, tune, and record RTTY broadcasts with. However, all the dealers I have called say that they will get them a week from now- exactly what they said last week, and the week before that.... Has anyone out there seen one? Played with one? Know anything at all about it that isn't printed on the single-sheet handout? Thanks!

ED,I PURCHASED ONE IN LATE MARCH. UNFORTUNATELY IT HAD A PROBLEM RIGHT FROM
THE START. AFTER 20 MINUTES OPERATION THE PLL CIRCUITS QUIT AND IT WILL NO
LOMGER STAY ON FREQUENCY. IN FACT IT WAS SO BAD ONE HAS NO IDEA WHERE IT
COULD BE (AT LEASRT NOT WITHOUT TEST INSTRUMENTATION). I HAD TO SENT IT
BACK FOR WARRANTY REPAIR AND HAVE NOT SEEN IT BACK YET, SO CAN NOT REPORT
FURTHER ON IT. PERHAPS I SHOULD HAVE PAID MORE ATTENTION TO THE COMMENTS
ON THE R70 IN THE WORLD RADIO HANDBOOK !

Larry,
 "WELCOME" to the phone bands. There are very few gentlemen on the phone sub-bands as you will soon (perhaps already) discover. Anyway, here's a breakdown of some of the frequencies on 20 fone (can't help much on 40 since I only operate 40 cw for DX).

14.227 Mhz- W7PHO Family Hour DX Net- Daily from 1500z to 1700z.

14.230 International Slow Scan TV calling frequency- might as well avoid this for a couple of Khz either side, because these guys will hassle you to death for "tearing up" their sync.

14.236 International DX Association- Daily from 2330z to 0100z.

14.243 International Amateur Radio Society- Daily DX net from about 2300z till...

14.309 Brown Sugar Net- Daily from 0300z till about 0500z. This net passes some traffic, handles some DX, and does some BSing (hence the name Brown Sugar). A good bunch.

14.313 Maritime Mobile Net- Daily net (all day) to service amateurs on the high seas- however anyone may check in, particularly those with traffic or willingness to handle traffic.

14.322 YL International SSB Net- also known as the YL System. Daily traffic and DX net. Anyone is welcome.

14.335 SEANet- Daily from 1000z to about 1500z. This net is the SouthEast Asia Net and checkins from all over the far east appear for the purpose of providing new countries to DXers.

Basically, the rest of the band (14.225 on up) is available for ragchewing, DX or whatever. The truth is, these nets and "special" frequencies which I mentioned are not the possession of any one person or group. It's just that if you are there and their net starts, they will do their best to stomp you. Legally, they have no right and must not interfere with QSO's already in progress. But in reality, it doesn't work that way and the little guy loses, so it's best to not mess with them unless you run lots of power and are willing to put up with nasty remarks, carriers, belches, and many other things that make 20 meter fone so much fun.

I suspect that forty is probably no better.

Anyway, good luck and see you on the bands.

73's Dave Hallidy KD5RO

K9IU, the club station at Indiana University would like to establish
some kind of dialog with other university club stations. Possibilities
include setting up voice and digital networks. At any rate, it might
be worthwhile to exchange information and experiences by whatever means,
whether it be on the air or via this forum (or by electronic mail).
If anyone out there has any interest, please send mail to:

Erickson Communications, in Chicago, had a USED R-71A for sale
on April 7. I understand that the original owner goes through
radios like a teenager through drugs.

My ICOM R-70 works well, but is not the easiest rig to operate.
The R-71A looks like a winner.

qst de k9eui
hr propagation forecast bulletin nr 18 from arrl headquarters
newington ct april 30, 1984
to all radio amateurs bt

the last full week of april was an exciting one for solar observers. there were many major solar flares, causing numerous ionospheric fadeouts. the solar flux reached 183 on april 29, its highest level in 17 months. this was a poor time for high latitude communication on any dx frequency, but transequatorial propagation was quite good most of the time. this is the same area of the sun that produced fireworks at the end of march, but the level of activity was considerably higher this time around. the active areas are near the center of the sun as this bulletin is being prepared. there is nothing of significance east of these sunspot concentrations, so it seems almost certain that the flux will be dropping rapidly during the forecast week. propagation will continue unstable most of the time through about may 7, but good spring conditions will prevail for a week or more thereafter. solar flux values should be between 130 and 100 during the first week of may.

several sporadic e openings have been observed on 28 and 50 mhz. there will be more and better times for this mode later in may, but the best and most widespread e skip is still a few weeks away.

much is heard on 28 mhz these days about the expected demise of dx on that band. the decline in high latitude dx on 28 mhz is seasonal, and it would have occurred even with still higher solar flux levels than we have had in recent days. this band is still good for work into south africa, south america and the south pacific islands, but paths like that to northern europe will not be working regularly again until autumn.

american sunspot numbers for april 19 through 25 were between 38 and 102 with a mean of 64.1 ar

According to Monitoring Times magazine (May 1984, pg 11), Russian NAVSAT satellites operate on 150.000 MHz. It is claimed that they "are quite audible on most any scanner even with indoor antennas."

Here in northern Illinois, I can hear these satellites for

about 10 minutes every 2 hours on my scanner with a ground plane antenna at 17 feet! I even heard one faintly using a 19" piece of wire on the back of a different scanner!

The telemetry sounds something like AFSK superimposed on a time standard signal.

Has anyone else out heard these signals?

SUMMER POSITION AVAILABLE

The Packet Radio Research Group is looking for talented, highly-motivated students to work on the design of a high-speed digital QAM modem for medium-range packet radio transmission. This will be a full-time summer position. Applicants will be expected to have some knowledge of microprocessors and a good background in algorithms for digital signal processing. For more information, please contact

Dr. Michael Flynn

I have a ~1960 Motorola UHF Base station anchoring down one corner of
my room. It supposedly works, has no rocks, is aligned for ~440 Mhz,
has a manual, has a self check meter to analyze all the test points,
and has enough steel and iron to make it weigh 70#.

Its free for the taking. All you have to do is come to Berkeley and
pick it up.

**** UoSAT Bulletin-63 00:00 28th February 1984 ****

** UoSAT-Oscar-9 Status **

Following major breakdowns in the Oscar-9 ground station at the University of Surrey shortly before the team left for the UoSAT-B launch campaign, it was impossible for any remaining members of the department to activate the spacecraft during our absence. We apologise for the disruption at this crucial time.

Until the launch of UoSAT-B on March 1st, daily bulletins will be used to describe the basic telemetry and modulation formats and give launch information. Following launch, Oscar-9 will be used for bulletins and information and to answer queries received to the largest possible audience. Eventually, it is anticipated that UoSAT-1 will continue to carry mostly bulletin material while UoSAT-B will generate housekeeping and experimental data, combined with Digitalker and other formats.

** Oscar-9 Schedule **

Tuesday 28th February	03:00	load bulletin-63
Wednesday 29th February	14:00	load bulletin-64
Friday 2nd March	14:00	load bulletin-65

The above schedule will allow users to receive one afternoon and one night pass of each bulletin up to launch.

** UoSAT-B Spacecraft status **

The UoSAT-B spacecraft was shipped to the Goddard Space Flight Centre on Thursday 9th February for two days of magnetometer and magnetorquer tests and calibration. These tests were performed most successfully and the spacecraft left for Vandenburg Air Force Base, California, on Saturday, 11th February, arriving there late Sunday. After installation in the clean room, 10 days were spent on final tests and calibration, rectifying a few interface problems and generally getting to know the complete system. Two days were spent in this period shipping UoSAT-B to MacDonnell Douglas at Huntingdon Beach for a brief period of thermal vacuum testing following inconclusive tests which indicated an unacceptably high level of contamination following thermal vacuum in the U.K. These indications were proved unfounded and the spacecraft returned to Vandenburg with a clean bill of health. (Sorry!) Pre-mate on Thursday 23rd February and final mating with the Delta launcher on Friday were both long, worrying affairs with a number of problems which were eventually all overcome. The UoSAT team returned, less all our freight, on

Saturday and Sunday 25th & 26th February, to finalise the groundstation organisation. The lack of all microcomputers and calibrated modulators and demodulators is likely to cause problems, however we are confident that all will be ready in time for launch on 1st March at 18:00 GMT.

** UoSAT-B Telemetry **

Below is a list of telemetry equations and modulation details - more will follow in our next bulletin when we have unpacked the rest of our documentation. Thanks are due to Harold Price, NK6K, who used his computer systems at Vandenburg to help generate the initial versions of these lists.

Checksummed TLM format. Channel format is:

nnvvvc

nn - channel number
vvv - value
c - To compute checksum, convert each ascii character into the binary, e.g. 'A', which comes in as 41H becomes 0AH. Exclusive OR all 5 values. Convert the lower four bits of the XOR answer to an ascii hex digit, e.g. 0BH becomes 42H, this character is the checksum.

A 1Eh cursor home character preceeds UOSAT-2 in each frame The number after UOSAT-2 on the header line is the date in YYMMDDWHHMMSS, W is day of week, 0-6. The date below is bogus, it wasn't initialized after the s/c was powered up. The s/c was in the Bldg 836 clean room when this frame was taken. Some of the data is thus nonsensical, although the format is correct.

UOSAT-2 0000010040621

00515101039B020112030102040235050 28F06025107031508032909026D
10515011000012005613010314000515000416000717736418736B19736A
20515321032222667723000124001725000726077427736728736829736 9
30515231016532284F330000340007350305360005377366383 53E39353F
40763641000542688043000744000045056246000247736148353949346C
50561751017252661653263154111055852F56000357306758736F593539
602105617BC762800C630041641003651C0E66140567340668000E69000F

Non-checksummed frame. Everything is the same as above expect that the checksum character becomes a space. This format is more pleasing to the human eye.

3	

The DCE currents will have small counts even when the DCE is off. We think this is due to the +10 coming in from the Nav Mag lines. If the Nav Mag is off (unlikely), the DCE currents will be zero when both it and the Nav Mag are off.

By the way, beacons are:

145.825 MHz

435.025 MHz

2401.1 MHz

The tones are the same as for Oscar-9, but the sense of mark and space have been reversed, to ensure more general compatibility with many microprocessors, i.e. 1200Hz = logic 0 and 2400Hz = logic 1. Serial data uses logic 1 as the idle level.

The deviation of the transmissions on 145.825MHz is greater than that on UoSAT-1, which should be beneficial to the majority of users. Special receivers optimised to receive the UoSAT-1 low-deviation signals may require wider filters for best effect on UoSAT-B.

** UoSAT-B Events **

The following events and keplerian orbital elements have been supplied by Phil Karn, KA9Q. The circular period / precession figures are from Jim Miller, G3RUH. The data is derived from different sources and is not directly comparable.

The liftoff time assumed is 17:59:00 GMT on 1st March, 1984.

Subj: Packet Radio Activity Report

The following reports on some interesting packet radio experiments on AO-10 this weekend. WH6AMX showed up for his baptism under fire and showed that, despite being 2500 miles from the nearest other packet radio station, he could get his act together. Rick has now QSO'd ZL1AOX, KA6M and W3IWI. On Sunday, W3IWI sent WH6AMX a file of about 1.2 kbytes length with good thruput in addition to a long rtty-style ragchew. Also on Sunday, W3IWI sent KA6M a total of about 9 kbytes of data plus several kbytes of rag-chewing. Packet SWLing this weekend were ZL1AOX, KA9Q (NJ), WB9MJN (IL), N5AHD (TX) and W4KDP (AL) plus perhaps others. It would seem that the biggest challenge we have now is to come up with some rcvr/modem hdwe that improves on the link performance achieved with FSK, and which is AFC controlled to minimize tuning touchiness. Also, we now need to get some stations set up with gateway capability so that local area networks in metropolitan areas (DC, LA & SFO will probably be first) can use the satellite to for inter-net ties. Any volunteers to work on these projects?

Subject: AX.25 P/F bit again!
Message-ID: <265@dsd.UUCP>
Date: Tue, 28-Feb-84 07:37:33 EST
Article-I.D.: dsd.265

To: All Packet Stations
From: Phil Karn, KA9Q
Subject: P/F bit (again!)

With the Trenton Packet Radio conference
coming up again soon, I think we are going to be forced to settle the

issue of proper poll/final bit usage in AX.25 once and for all.

For those of you unfamiliar with the problem, here's a short primer. The P/F ("Poll/Final") bit in the control field of each X.25 level 2 frame is provided for asking the status of the other end of a link, particularly after a timeout. Since the Poll (inquiry) and Final (response to inquiry) functions share the same bit, resulting in identical control fields, the distinction is made in X.25 LAPB point-to-point links by looking at which address (yours or his) is present in the address field. If it contains your address, the frame is a poll command to which you must respond; if it contains the other station's address, it is a response to your poll. The distinction is necessary because both stations might poll each other simultaneously, a very likely possibility if a momentary link failure or QRM affects both transmission directions.

Unfortunately, when we invented the addressing scheme for AX.25, we lost this information. The address fields are always the same - they contain both callsigns. Therefore you cannot reliably determine if a frame you receive with the P/F bit set is a command or a response. While X.25 LAPB does provide for an alternate way to recover after a timeout (by sending ONLY the oldest unacknowledged I-frame in hopes of generating an S-frame response with an indication of what the receiver expects) there are other situations which require a better solution.

1. The current TAPR implementations appear to send ALL unacknowledged I-frames after a timeout, which is forbidden under LAPB. This can result in inefficient use of the channel, particularly if the timeout was due to the receiver's acknowledgement being lost.

2. When the remote end becomes busy (say, due to a slow printer), it sends a RNR (receiver not ready) to flow control the sender. LAPB requires the sender to wait for a RR (receiver ready) before sending more information. It is SPECIFICALLY FORBIDDEN for the sender to send any more I-frames before getting explicit permission from the receiver in the form of the RR frame. Since this RR frame could get lost, the sender could wait forever; therefore it is strongly recommended that the sender take the responsibility of periodically polling the other end to see if the busy condition still exists. Polling with the P/F bit takes much less channel bandwidth than sending unwanted I-frames in the hopes that the receiver might be ready for them.

Unfortunately, in the TAPR implementation, it appears that the sender periodically resends all the I-frames which the receiver could not accept, over and over again, until the receiver can finally take them. Besides being in violation of the protocol, this uses the channel inefficiently. Right now, this isn't too much of a problem because our links are generally slower than our computers or terminals. However, when our link speeds surpass our computer or terminal rates and flow control becomes common, we'll find ourselves wasting a lot of the extra channel capacity on retransmitted I-frames. Clearly the problem must be solved.

Therefore, I would like to formally propose the following modifications to the standard. Basically, I am proposing that we use some reserved bits in the SSID byte of the source and destination address fields to contain the information formerly provided by the address field of X.25 LAPB. This can be done in an upward compatible way, preserving compatibility with existing implementations of AX.25.

For the purposes of this section, bits within octets (bytes) of the address field are numbered from 1 to 7, with bit 1 being the least significant bit (the address extension bit.) Currently, the AX.25 standard calls for bits 6 & 7 to be reserved and set to 1. I would now define a use for bit 7 of the source and destination SSID bytes; bit 6 in all address SSID bytes would remain reserved and set to one, while both bits 6 & 7 in repeater SSID bytes (if any) would remain reserved and set to one.

An upward-compatible AX.25 station would determine if the station it is in communication with also has the "new" standard by comparing bit 7 in the source address SSID with bit 7 in the destination address SSID of received frames. Since the present standard calls for these bits to be set to 1, equality would indicate that the other station is an "old" implementation and the "new" station would act accordingly (i.e., according to present procedures).

However if the bits differ, it can then determine if a given frame is a command or response by whether the source or destination SSID field has bit 7 set, using rules analogous to LAPB. In other words, if LAPB would call for a given frame to be sent as a "command", i.e., with the other station's address in the address field, bit 7 in the destination SSID byte is set to one and bit 7 in the source SSID is set to zero. If LAPB would call for the frame to be send as a "response", bit 7 in the source SSID would be set to one and to zero in the destination SSID.

Summarizing in tabular form:

X.25 LAPB addressing rules:

Direction	Command	Response
A->B	B	A
B->A	A	B

AX.25 (revised):

	Command (either direction)	
dest SSID bit 7		src SSID bit 7
1		0

	Response (either direction)	
dest SSID bit 7		src SSID bit 7
0		1

Note that the same callsign (that of the commanded station) would have bit 7 of its SSID set in both the command frame and its response. This is because the commanded station's callsign occupies the destination

field of the command, while it occupies the source field of the response. On the other hand, bit 7 of the commanding station's SSID byte would be zero in both the command and response frames.

Since all X.25 frames are classed as either "commands" or "responses", even when there is no ambiguity (e.g., I-frames are always commands), all AX.25 frames should also be marked as such.

This proposal has the following advantages:

1. Upward compatibility with existing implementations of AX.25 which comply with the "old" requirements concerning the reserved SSID bits.

2. Conceptual conformance to LAPB with respect to "commands" and "responses" when communicating with other stations also following this "new" protocol. The AX.25 address which is "marked" by bit 7 in its SSID byte corresponds to the choice of address "A" or "B" which would normally be used in LAPB. This allows much closer adherence to well-established LAPB procedures for link recovery and flow control, and much better channel utilization under these conditions.

3. Minimization to the greatest possible extent of the procedural differences between AX.25 and CCITT X.25 caused by the former's specialized addressing scheme. This would allow cleaner implementations that draw upon existing procedures developed in non-amateur X.25 networks.

Comments, constructive flames, etc, are invited.

73, Phil

Subj: Packet radio

Wow! I knew packet radio was popular down there, but I wasn't aware just how many there really were. Here's a status report on activities in NJ:

Rip and I have been on 145.01 more or less continuously for the past 2 weeks. The only problems that have surfaced are a RTTY bulletin board and ragchew frequency on 145.02, and occasional simplex FM operation on 145.00. Neither are particularly troublesome, but to be candid, both the RTTY folks and we are eyeing each other cautiously. They are considering a move up 15 khz, which will help matters. I am working on getting them interested in packet, but they certainly are reluctant. I can't understand how somebody who advocates going right out and spending $300+ on a flashy RTTY TU can balk at buying a TAPR board. I think some education is in order here, and am in the process of preparing a packet radio roadshow I can combine with my existing AMSAT pitch. I have already gotten requests from several north NJ and NYC radio clubs to give talks on both topics, so I think this is a fertile but very undeveloped area. It would also help if we could establish 145.01 as a "recommended" 2 meter packet radio frequency, perhaps with the help of W4RI and ARRL. The local repeater council has decided to stay out of the business of "regulating" simplex operations, so they are of no help.

I have purchased a old TR-22C transceiver and 30 watt amplifier. As soon as I get crystals, I can dedicate it to packet along with one of my TNC boards (although I haven't had to preempt the TR-9000 very often lately.) I also have a disused CP/M system which I may be able to set up as an RBBS, once I do the necessary work to add flow control.

I live on the side of a hill, near the top, in Warren Township, NJ (40.658N, 74.444W, ~625'). While my elevation is good and my coverage of NYC is excellent, the top of my tower is barely level with the top of the hill to the west. However, my landlord also owns a partially completed house on the very top of the hill which is home to a 220 repeater and 2m contest site; I haven't asked him yet, but I can probably get permission to move the repeater up there. That would also put a little distance between it and my 2m satellite antenna...

>From my home QTH (using the satellite array) the path to WA2LQQ is absolutely solid, although he is currently plagued by occasional local QRM which wipes out the band. He is typically full scale over about 40-50 miles. Steve Robinson asked me to listen for a 2m repeater east of Philadelphia which he is considering as a site for his digipeater; I can hear it, but it isn't terribly strong. However, moving to the top of the hill will probably help. I suspect that WB4APR's station will have no trouble getting into that site (Mt. Holly, NJ). Once we do that, we'll have it made!

Phil

Subj: GRIDX program notes

The program GRIDX.BAS is intended to provide a simple way for AMSAT members to calculate the "Maidenhead" grid square designators on their home computers. This program allows input in either Longitude/Latitude or Grid Square formats and will calculate the other format.

If a grid square is given to less than 6 character precision on input, the center of the square defined by the characters is assumed. For example, W3IWI at 76.936 degrees west and 39.185 degrees north yields grid square FM19ME. If the grid location FM19 is specified, then the center of FM19, which is at FM19LL is assumed. From my location, this is about 30 km away.

Another feature of this program is that it gives you the range (along the surface of the earth) and azimuth from the first station entered (called 'home') to the target stations.

The GRIDX program was adapted from an earlier W3IWI program called GRID (which was rather machine specific). It was written and tested in North-Star (N*) disk basic (running under CP/M) and runs in N*, SoHo or BAZIC as is. I wrote the program with transportability in mind. The major N* "quirk" that you should have to adapt to other dialects is in the area of string notation. N* explicitly calls out string members. For example, if G$="ABCDEFGHI", then G$(3,5)="CDE". Microsoft uses the MID$ function to accomplish this and would get the same sub-string with MID$(G$,3,3). Similarly, G$(1,1) in N* is "A"; to get this in Microsoft, you would use either LEFT$(G$,1) or MID$(G$,1,1). Another minor change that is necessary (line 1830) is to change N*'s SQRT to SQR in most other dialects.

When any of you get versions of this or other "grid" programs running,

please make them available thru the AMSAT Software Exchange.

73, Tom

Subj: More Uosat-B Predicts

   Just to add confusion, here are some more predictions
for Uosat-B, calculated by G3RUH here in England, from
Harolds original data.

'OLD TYPE'

Orbit No   : 0

Eqx date   : Mar 1st 1984
Eqx time   : 18:59:25 GMT
Eqx long   : 320.38   deg.w
Mean hgt   : 687   km
Period   : 98.5045   mins
P-drag   : 8.3E-6   *N-ref
Long inc   : 24.6251   degs
L-drag   : 2.1E-6   *N-ref
Inclination : 98.26   degs

'KEPLERIAN TYPE'

Afiliation Set   : UOS-G3RUH/1(pre launch)
Epoch time   : 61.7990741
   19:10:40 GMT March 1st 1984
Inclination   : 98.25967   deg
RA of node   : 124.24   deg
Eccentricity   : 0.0004139783
Arg of perigee   : 174.17   deg
Mean anomaly   : 227.01   deg
Mean motion   : 14.61862   rev/day
Decay rate   : 1.8E-5   rev/day^2
Epoch rev   : 0
Semi Major Axis : 7065.31   km

If launch time changes.

For 'OLD TYPE' : add/subtract correction to Eqx time.

For 'Keplerian' : add/subtract correction to epoch time AND
                  add/subtract 4.178E-3 deg/sec to RAAN

 These, by the way, are similar to PKARN's numbers (but not exactly the same !)

AUTOLINK OTTAWA
TO EVERYONE
GANG,

1.5 man months were expended yesterday during the premate (32 people * 12 hours). The problems were too numerous to go into here, I've got several minutes of video tape you can all look at some time. There where no problems attributable to uosat-B. We called it quits at 4:00am and got it again at 10:00 this morning. We should be ready to go to the pad shortly after noon today, if nothing came up.

Larry, pls forward to TM, thanks.

END, REGARDS LARRY

Subj: Uosat-B status, thursday evening.
Gang,

Just got back from the mate. The 1 hour procedure lasted from 14:00 to 20:00 and still isn't done. Some of the things that were done last nite got disaproved overnite and had to be redone. Some new problems cropped up at the pad. The caps on the pyros still need to be put on, and one of them looks like it will hit the 1.2 Ghz antenna support which may require milling of something somewhere. Two 2m/70cm antennas need to be put on and the array covers removed. We had to clear the pad for the Landsat guys so Martin will finish up tomorrow. Although all the over time business seems dire, there should be no problem getting launched. The NASA and MDAC crews have been great, as has everyone else. It was a real experience, hopfully the hour + of video will give you some of the feel of the goings on. Most of the Surrey crew leaves for LA tomorrow morning, Martin stays till the weekend and

Ian stays for the launch. The Surrey crew going to LA leaves for the UK at 20:00 Friday.   Collin is staying with me thru launch.

That's it from here, back to packing.
(Colin points out that there is only one L in Collin, but what can you expect from a bloke who spells color wrong?)

Harold.

Subj: re urgent msg and uos-b stat
Dick, your urgent msg has been delivered to Martin and is being worked.

Status as of 4PM EST today is all mounted with only a plastic bag to remove and some minor taping to do. Farings are next, main crew leaving Sat for UK unable to leave today due to strike action on airline. things are looking good

regards to all, Larry

Subj: Uosat-B status, friday nite
We (Colin, Roger, Dave, Mike, and Nevil) arrived in LA around 19:00 this evening. Part of british airways is on strick, so they won't be going out today. This has also made shipping the bits of the ground station to Surrey in time for launch somewhat of a trickey proposition as well. Perhaps more trouble on the ground means less trouble on orbit. Martin just called after getting back from the (22:00 local) to say that the fairing had been installed and there was 1/8" to spare. After final positioning, we have one inch clearance, even more than called for. All is well, we got past the two last hurdles, the fairing installation and the F-3 review. The F-3 review is the last major planned time when UOSAT-B could have been disapproved and de-mated. We passed. The only open item before launch can be approved is checking for correlation between the solids on the delta and the failed solids on the PAMs on the last shuttle mission. The has to be looked at but is not viewed as a highly probable item.

Anything can happen between now and 17:59 utc Mar 1, but all is go at this time.

The 1.5 hour of video tape came out well. Many pics were taken.
Details on availability when available.

Harold.

The only thing left is removal of the safe plugs and
installation of the arm plugs,

shortly before launch.

Subj: TAPR TNC Modem Mods de KV7B

Tom,

     For some reason my as-the-news-is-unfolding style confused a number of people, you among them, I guess. The last item I sent, which is repeated below in case it went thataway, is the canonical document. One possible item not mentioned in it is that increasing the value of the cap. hanging off pin 8 of the 2211 will probably improve your ber at low s/n, at the expense of any operation at 1800 baud. (I realize that 1800 baud operation was not what we were trying to optimize, but it was refreshing to have something go so right that we were getting more than 90 percent on average length packets at 1800 baud. The increase in value of the cap. on pin 8 should be by about a factor of 4/3, which cuts the detection bandwidth and hence ups the berper-formance.)

NEW MODEM DETAILS

Over the last couple days I've been keeping you up to date with
our discoveries about the TAPR modem. We've completed our tests, and
this note will describe in detail exactly what to do to convert
your modem. We've tested out the new design and it is MUCH better than
the old one. Whereas before FM noise at the level of light popcorn was
enough to kill communication, this is not true with the new modem. I have
no doubt the modifications below will make the modem operate properly on
OSCAR 10, and will probably improve matters vastly on HF too.

In addition to the modifications improving the 1200 baud design, we have also come up with an optimized 300 baud design centered at 1700 Hz designed for HF/OSCAR use. It should exhibit the same good noise immunity that the 1200 Hz design shows.

On to the mods.

For Kit Boards

1. Change C20 to .0047 microfarad (on U34)
2. Change R46 to 47K (also on U34)
3. Look carefully at the trace just below U21, just above C18 and R39. This trace connects U18, pin 7 to J5, pin 18. On the top of the board, attach a 4.7K resistor between the plate-through hole at the right end of this trace and the trace leading to pin 1 of U18. This will be the new +12 volt pullup on U18, pin 7.
4. Notice this trace passes under R76, R77, R79, and R78 on its way to J5. Just to the right of these resistors AND THE PLATE-THROUGH HOLE ADJACENT TO R78
   break this trace carefully, exposing about 1/16 in. of bare board.
5. Attach a VN10KM (available at Radio Shack, etc.) as follows: The drain should go through the plate-through hole. The source should go to the ground strip at the bottom of R78. The gate should be soldered to the trace coming from U18, pin 7, which was just cut.
6. Recalibrate the modulator center frequency to 1685 Hz by typing
   cal:3/1094
   while in calibrate mode.

This completes the modifications.

For Beta Boards

1. Change R25 to .0047 microfarad.
2. Change R14 to 47K.
3. Carefully lift the left end of R11 and re-attach it to the nearby +12 volt power bus on the wire-wrap area.
4. Add a 4.7K pullup on the bottom of the board between U17, pin 27 and the nearby +5 volt trace attached to the .1 microfarad cap. between U17 and U25.
5. On the top of the board, locate the trace coming from JP3 which goes to a plate-through hole near the left end of J3. Turn the board over and follow this trace until it ends at a plate-through hole under U17. This is the trace connecting JP3 and pin 27 of U17. Cut the trace near the plate-through hole under U17.
6. Attach a VN10KM under the board as follows: Attach the drain to the plate-through hole. Attach the gate to the trace leading back to JP3. Attach the source to pin 28 of U17 (the nearest ground).
7. Recalibrate the demodulator freq. to 1685, as above. You're finished.

300 Baud Modem Modification

For Kit Board

1. Change C21 from .0022 to .01 microfarad
2. Change R46 to 220K.
3. Set high tone to 1800 Hz (cal:2/1024)
4. Set low tone to 1600 Hz (cal:1/1152)
5. Set center frequency on the 2211 to 1700 Hz (cal:3).
6. Go for it.

For Beta Board

1. Change C11 from .0022 to .01 microfarad
2. Change R14 to 220K.
   (Note: this can easily be done by making up a jumper plug
   to fit over JP2 with 227K - 47K = 180K)
3. make modification to modulator to allow low tone to be set to
   1600 Hz: change R28 to 24K.
4. As above.

Note: Due to differences between the kit and beta boards, the calibration
lights will not operate properly on the beta board. At the correct
frequency one light will probably be out or dim, and the other will
be on.

Performance: You should notice the modem requires much less
audio than before, perhaps to the bottom of your volume control range.
You should also find you're decoding weak signals much more reliably.
Finally, you may find you can operate at hbaud greater than 1200. (Check
for legality first!)

Credits:
This modification is primarily due to the diligence of Eric
Gustaffson, who made extensive measurements, and carefully analyzed his
results. We take our hat off to him!
73
Dan
MODEM NOTES

I've received several requests for alternative part numbers for the
replacement cap, resistor and mosfet. The cap can be a garden
variety ceramic, the resistor can be a 5 percent 1/4 w, and the mosfet can
be either the originally specified VN10KM (available in places from RS) or
an IRFDZ13 mosfet, which is RS part number 276-2073, and which
should be in stock everywhere.

Again, I'd like people to let me know how this modification
works out when they've put it in. Thanks
73
Dan

My father-in-law in New Mexico is preparing to replace the
bamboo spreaders in his Cubic Quad antenna. Does anyone have
a source for Fiberglass spreaders--or reject pole vaulting
equipment suitable for this purpose? I once had an address
in L.A. but can not locate the firm.   Thanks for any
assistance you are able to provide.

A Guide to the Architecture of UoSAT-B

The following attempts to provide a guide to the sub-systems on the UoSAT-B spacecraft, due for launch on 1st March, 1984. Expanded specifications of individual modules will be made available for those experiments which supply data to the downlink directly or via the telemetry system.

Mechanical Framework

The spacecraft is constructed in a similar way to Oscar-9, that is with a square-section central core supporting rigid top and bottom plates. Solar cells are mounted on all four sides of these plates, enclosing a basic cuboid of dimension 35.5 * 35.5 * 58.5 cm. Two stacks, each of two module boxes of dimension 23.5 * 17.6 * 3.1 cm, are mounted on the outside of each face of the central core. A 'wing' extends the base of the spacecraft symmetrically by 16 cm on each side in one axis to permit the mounting of two SHF helical antennas, one on each side of the launcher attach fitting which is itself mounted in the centre of the bottom plate. The Navigation Magnetometer and Space Dust experiments are mounted above this wing, one on each side.

Solar Cells

Four solar arrays of dimension 49.5 * 29.5 cm are attached to the four sides of the spacecraft. These are capable of supplying up to about 0.9A at 28v when fully illuminated. The cells were manufactured by Solarex.

Battery

A solid octagonal block of aluminium, 14.9 * 14.9 * 10.2 cm, is fitted into the centre core of the spacecraft and is drilled to accept ten 'F'-sized Nickel-Cadmium cells, each 3.2 cm in diameter and 9 cm long. These cells, in series, form a 12v battery of 6.4Ah nominal capacity and are charged when the spacecraft is in sunlight in order to provide sufficient power to run the craft during peak load demands and its eclipse periods.

Battery Charge Regulator

Two redundant BCRs are responsible for accepting the 28v supplies from the solar cells (and a similar supply from the umbilical connector) and charging the battery as required depending on the current drain, the battery voltage and the battery temperature.

Power Conditioning Module

The PCM regulates the 12-14v battery bus supply to provide 10v, 5v and

-10v supplies for powering the spacecraft systems and experiments.

Power Distribution Module (PDM)

The PDM switches the various regulated and unregulated rails to all the s/c systems and experiments, dependent on the commands which it receives from the Telecommand system. Each switch has an individual current foldback facility so that a faulty module is allowed to draw up to a pre-determined current before it is latched off, necessitating a power-down under positive command before resetting.

Telecommand system

The telecommand system comprises three uplink receivers, three data demodulators, a command detector and sets of command latches which hold the status of the command specified. The receivers are located in the 144MHz, 438MHz and 1268MHz amateur bands and the demodulators are robust devices which do not depend on phase-locked loops or other potentially unstable techniques. A command detector scans the three receivers according to a priority system and detects a valid set of command instructions, passing the data contained therein to the relevant latch. Some latches drive a set of multiplexer address inputs directly so that uplink and downlink path selection may be performed immediately on the command latch board.

The 112 command latches drive the Power Distribution System, the remaining spacecraft systems and experiment functions. There is a parallel i/o port to the spacecraft 1802 computer for autonomous control of spacecraft operations in addition to serial data links with the 1802 computer and the DCE for backup operations.

145.825 MHz Beacon

The 145 MHz beacon on UoSAT-B is nearly identical to the one flown most successfully on UoSAT-1. The modulation index has been increased in order to ensure more optimum reception on most radio amateur receivers. Modulation is by frequency-shift keying, as on UoSAT-1.

435.025 MHz Beacon

This beacon is a completely new design which generates its frequency standard from a phase-locked synthesiser system. As a result, the DC to RF efficiency is much improved. In addition to frequency-shift modulation, phase-shift modulation is a switchable option.

2401.5 MHz Beacon

When the original supplier of the 2.4GHz beacon was unable to meet his

commitment, Colin Smithers, G4CWH, at the University of Surrey stepped in and designed and built the transmitter and power supply in under four weeks. The DC to RF efficiency has been improved by some 5 times over the UoSAT-1 implementation. Both AFSK and PSK modulation methods are possible.

Telemetry System

The basic output of the UoSAT-B telemetry system is very similar to that of UoSAT-1. However, 60 analogue channels, digitised to 3 decimal digits, and 96 status points encoded into hexadecimal digits are available together with a real-time clock for frame identification and the satellite identifier, 'UOSAT-2'. A checksum digit can also be added to each channel. A dwell facility has been added so that up to 128 channels can be output in rotation, combined with clock times and line feeds or frame ends in any combination.

1802 Computer & Digitalker

The 1802 computer has been designed to support all the modules on the spacecraft, as well as to control the overall scheduling and be usable for specific communications experiments. To satisfy these requirements, the computer has access to many modules via parallel interfaces, and to some of the others and the receivers and transmitters via serial connections. In addition, there is a real-time clock and a total of 48kb of RAM for data storage. The Digitalker speech synthesiser is housed with the 1802 and has ROMs containing over 550 words. These will be used initially for 'speaking' telemetry.

Navigation Magnetometer

The Navigation Magnetometer is a three-axis flux gate device, much upgraded from the one flown on UoSAT-1. Indeed, the 14-bit resolution is very similar to that obtained from the much more complicated scientific magnetometer on the previous craft. The Nav. Mag. will be used for determining the attitude of the spacecraft during initial manoeuvres, as well as for experimental measurement of magnetic field disturbances once the attitude is stable.

Magnetorquers & Boom Assembly

Magnetorquers - coils of wire energised to act as electromagnets - are built into all 6 faces of the spacecraft, wound around the edges of the honeycomb panels supporting the solar cells and the top and bottom plates. The fields created interact with the earth's magnetic field to produce a torque which tends to rotate the spacecraft.

When the spacecraft has been positioned so that the CCD camera end is pointing towards the earth - a long and complex process - a boom can be

extended from the top of the craft. The boom looks similar to a steel tape measure, although nearly circular once it has been unrolled, and some 12 metres long. The boom carries a 2.5kg mass on the far end and this, in conjunction with the spacecraft body at the other end, creates a 'dumb-bell' configuration which naturally lines up with the earth's gravitational field so that one end points downwards, rather like a pendulum - it is, however, bi-stable! Any residual swinging motion can be damped with further controlled applications of the magnetorquers.

Sun Sensors

The sun sensors are made with specially fabricated solar cell substrates which are masked by grey-code stripes and illuminated by light passing through a slit in a metal foil in front. The mask coding on the cells can be used to derive the angle at which the incident light is falling on the slit. 6 such sensors are mounted around the top plate to provide complete 360 degree coverage.

Horizon Sensors

Built by a first year student at the University of Surrey, the Horizon Sensor is able to detect when only one of two photodetectors is illuminated. The detectors are housed in two narrow tubes of 4mm diameter and mounted at a small angle to each other so that the whole sensor thus detects the 'edge' of an illuminated object. This will be the earth, the moon or the sun and a fix can then be made on the object's position.

Digital Communication Experiment

The Digital Communications Experiment (DCE) was designed and built by AMSAT and VITA groups in the USA and Canada. It has two serial ports which can receive and transmit to the RF system and the 1802, as well as an NSC-800 CPU and nearly 128kb of CMOS RAM. The DCE will be used to investigate various packet radio protocols for use with a future digital 'store-and-forward' satellite being planned by AMSAT. In addition, the DCE has interfaces with the navigation magnetometer and the telemetry system for long-term data storage.

Space Dust Experiment

The Space Dust experiment was built by a group of students at the University of Kent, England. It has a dielectric diaphragm which, when punctured by a large particle, discharges the capacitance associated with it, therby indicating the impact. In conjunction with a piezo crystal microphone which detects particles of smaller size, correlation techniques can yield a measurement of the momentum of the incident particle.

CCD Camera

The CCD camera is a re-designed version of the device flown on UoSAT-1. Indeed, the CCD array at the centre of the camera is the same type as used before, although the later batches of this part are substantially improved over the early one used 2 years ago. This time the analogue electronics surrounding the array are also greatly improved. The active area of 384 pixels by 256 pixels is stored with seven bits of grey-level, in 96kb of RAM in the DSR experiment. The DSR is then responsible for the picture downlink, adding addresses and error correction and detection information as required. The DSR downlink is organised in packets of 128 bytes each, three across each imager line, so that two may be selected for display (using an extra digital filter) on existing UoSAT-1 CCD displays. The variable video amp gain and integration period of the CCD imager have been set up to provide the latitude required to photograph both land images and also auroral features, the latter being of interest in conjunction with the particle detector experiments.

DSR Experiment

The DSR stores data from the CCD imager, particle counter experiment or computer UART and outputs it in a checksummed format. The unit has 2 banks of 96k x 8 CMOS memory which can be used as two seperate banks or as one 192kb bank. The output frame consists of a three byte sync code, a two byte frame address, 128 bytes of data and 5 bytes of error detection/correction code. The data is sent in serial form with start bit, 8 data bits and selectable 1 or 3 stop bits. The data can be output at 1200, 2400, 4800 and 9600 BPS.

Particle Detectors and Wave Correlator Experiment

Three Geiger counters, each with different electron energy thresholds, similar to those flown on UOSAT-1, and a multi-channel electron spectrometer are mounted on the spacecraft to serve as a near-earth reference for magnetospheric studies to be carried out concurrently with the AMPTE & VIKING spacecraft missions due for launch later in 1984, and for ground-based studies of the ionospheric D, E and F regions being pursued with riometers and EISCAT. Data will be available in either real-time or, for more detailed analysis, from stored measurements over both polar auroral regions to professional scientists and radio amateurs. A data-base of the measurements acquired over the life of the spacecraft will be established at Surrey in conjunction with the SERC and will be available to approved experimenters.

The modulations imparted on particles, as a result of wave-particle interactions in the magnetophere on auroral field lines, will be observed by a Particle Correlator Experiment designed around an NSC-800 microprocessor at the University of Sussex, England. The measurements

will identify wave-modes responsible for accelerating electrons into the auroral beam and will also identify wave-modes which limit the further growth of the auroral beam.

Roger M. A. Peel, G8NEF,
University of Surrey, England.

Everything appears to be on schedule for the launch of UoSAT-B aboard the Delta that will also carry Landsat-D'.

Liftoff is scheduled for 1 March 1984 (tomorrow) at 17:59 UTC from Vandenburg Air Force Base in California. The Goddard Amateur Radio Club, WA3NAN, will carry audio feeds on 14.280, 21.280 and 147.45 mhz. There are no plans for full-scale net and W1AW coverage.

All remains "GO" for the launch of Landsat-D' and UoSAT-B
from Vandenburg Air Force Base in California. The arm plugs
have been inserted in UoSAT and the launch tower rolled back.
Launch is scheduled for a 6 minute window starting at 17:59 UTC;
WA3NAN will carry audio coverage starting 1/2 hour before launch
on 14.280 and 21.280 mhz.

Assuming a nominal orbit, the first pass visible to the eastern
US will occur just after 7pm local time. Frequencies are
the same as UoSAT-Oscar-9: 145.825 on 2 meters, and 435.025
on 70 cm.

UoSAT-Oscar-11 was successfully launched from Vandenburg Air Force Base,
California today at 17:59:00.8 UTC. After a coast period and second
burn of the Delta launcher's second stage, the Landsat-D' separation
took place. Separation of UoSAT-Oscar-11 took place several minutes
later while the launcher and satellite were in view of the command
station at the University of Surrey, England. First telemetry signals
were heard by G3IOR on 145.825 mhz several minutes after separation
when the command station turned the beacon on.

The UoSAT-B spacecraft riding as a piggyback with the Landsat-D Prime satellite was successfully orbited today (March 1,1984) from Spacecraft Launch Complex 2W (SLC-2W) at Vandenberg AFB. Launch was aboard a Delta 3920 vehicle, the 174th member of the highly successful Delta series. This marked Delta's 163 success -- an enviable 93.7% track record. NASA is now phasing out the expendable Delta series and replacing it with the reusable Shuttle.

Liftoff went like clockwork, within one second of the nominal 19:59 UT. Following the deployment of Landsat, the UoSAT spacecraft separated from the second stage of the launcher at about 21:11 UT. The telecommand station at the University of Surrey sent commands to initialize the spacecraft software and activate the 145.825 MHz beacon for a few seconds. The few seconds of telemetery showed that the spacecraft was in good health, so an additional command was sent to acquire about 5 minutes of data. We are informed that on the second orbit, at about 22:30 UT, the spacecraft will be commanded on for a 5 hour period. Thus the first passes visible in the US will be on March 2 at about 00:05 UT on the east coast, at about 01:40 UT for the eastern half of the US and about 03:20 on the west coast.

The spacecraft is in a nominal orbit with inclination 98 degrees, period 98.6 minutes and altitude 690 km. Improved orbital data should be available later today after the radars can separate UoSAT from Landsat and the launcher. The international designator for UoSAT-OSCAR-11 is 1984 021B; the NASA/NORAD catalog number will be know when we get the first Keplerian elements.

I talked with Dr. Martin Sweeting, G3YJO (the Surrey project manager) as the first signals were being received at Surrey and heard them over the phone. Martin was elated at the success and I conveyed our congratulations on his success for all of AMSAT. AMSAT is proud to have played a small role in making this newest amateur satellite come to life.

The ALINS broadcasts were carried on 14.280, 21.280, & 147.45 MHz from WA3NAN. Good reports were received from Europe on 15. After it was determined that 20 was not doing very well, that transmitter QSY'd to 7.180. W3IWI played the role of "mouth of AMSAT" and KA1TB manned the WA3NAN facility. Also present in the control center at Goddard were Bill Lazzaro and Dick Daniels of AMSAT and Gary Garriott of VITA.

73, Tom

PRNTET.BR

13:35 CST (UoSat Oscar 11 separation + 25 minutes)

     I just received a phone call from Harold, who had just phoned Surrey. He reports:

ALL ABOARD OSCAR 11 IS NOMINAL. Immediately following separation, the two meter beacon was commanded on for a single block of telemetry. All telemetry appears nominal. The beacon was again turned on for a five minute interval. That was all that could be accomplished before LOS at Surrey. The current plan is for Surrey to turn on the beacon continuously next pass.

Congratulations to all. It looks like a real healthy bird.
(Landsat-D prime is healty too.)

Subj: UoSAT-OSCAR-11 in orbit
The UoSAT-B spacecraft riding as a piggyback with the Landsat-D Prime satellite was successfully orbited today (March 1,1984) from Spacecraft Launch Complex 2W (SLC-2W) at Vandenberg AFB. Launch was aboard a Delta 3920 vehicle, the 174th member of the highly successful Delta series. This marked Delta's 163 success -- an enviable 93.7% track record. NASA is now phasing out the expendable Delta series and replacing it with the reusable Shuttle.

Liftoff went like clockwork, within one second of the nominal 19:59 UT. Following the deployment of Landsat, the UoSAT spacecraft separated from the second stage of the launcher at about 21:11 UT. The telecommand station at the University of Surrey sent commands to initialize the spacecraft software and activate the 145.825 MHz beacon

for a few seconds. The few seconds of telemetery showed that the spacecraft was in good health, so an additional command was sent to acquire about 5 minutes of data. We are informed that on the second orbit, at about 22:30 UT, the spacecraft will be commanded on for a 5 hour period. Thus the first passes visible in the US will be on March 2 at about 00:05 UT on the east coast, at about 01:40 UT for the eastern half of the US and about 03:20 on the west coast.

The spacecraft is in a nominal orbit with inclination 98 degrees, period 98.6 minutes and altitude 690 km. Improved orbital data should be available later today after the radars can separate UoSAT from Landsat and the launcher. The international designator for UoSAT-OSCAR-11 is 1984 021B; the NASA/NORAD catalog number will be know when we get the first Keplerian elements.

I talked with Dr. Martin Sweeting, G3YJO (the Surrey project manager) as the first signals were being received at Surrey and heard them over the phone. Martin was elated at the success and I conveyed our congratulations on his success for all of AMSAT. AMSAT is proud to have played a small role in making this newest amateur satellite come to life.

The ALINS broadcasts were carried on 14.280, 21.280, & 147.45 MHz from WA3NAN. Good reports were received from Europe on 15. After it was determined that 20 was not doing very well, that transmitter QSY'd to 7.180. W3IWI played the role of "mouth of AMSAT" and KA1TB manned the WA3NAN facility. Also present in the control center at Goddard were Bill Lazzaro and Dick Daniels of AMSAT and Gary Garriott of VITA.

Subj: Oscar-11
Hi, There!

Oscar-11 has been successfully commanded on during the first
three passes over Surrey this evening. All the first
indications are that the spacecraft is in very good shape and
that the initial checkout will proceed faster than expected.

On the first pass over Guildford (during which,
coincidentally, Oscar-11 was ejected from the launcher) all
the primary systems were powered up (receivers, battery charge
by separation switches, telemetry, computer, navigation
magnetometer by telecommand). The computer was then
bootstrapped and generated about 10 seconds of telemetry.
During the rest of the pass, another 2 bursts of telemetry of
about 4 minutes duration were generated by command through the
computer loader.

On the second orbit, a short and long burst of telemetry were
again generated. During the second burst, a beacon multiplex

command was issued on the 144MHz uplink and this was correctly received - full duplex 144/145 MHz operation! The second half was occupied loading a short 1802 program which transmitted for 80 minutes, the beacon multiplexers again being set to telemetry.

The third and last pass at Surrey for this evening was spent loading a similar program to the last one which will transmit for 10 hours, i.e. until just before AOS at Surrey tomorrow morning. All temperatures on Oscar-11 are still settling and reports throughout the night on Telemail would be welcome.

Activities tomorrow include the testing of various other 1802 computer I/O ports before running other programs to record whole-orbit telemetry and other housekeeping functions as battery charge and temperatures dictate.

We would welcome reports, both telemetry and AOS/LOS times, and will issue a further bulletin via Telemail and Oscar-9 later tomorrow.

Roger Peel G8NEF & UoSAT Team University of Surrey.

P.S. Jim Miller, G3RUH, and Phil Howarth, G3YAC, report that the original orbital predictions are very accurate. Their only refinement after doppler measurement of the initial 3 incomplete passes indicates that the time of equator crossing should have 8 seconds added. More measurement tomorrow.

Subj: Post launch report
Colin and I are back in LA after an eventfull trip to WTR today. Video tapes of the launch came out well. Ian got good coverage from about 6 seconds away, I got some stuff from 26 seconds away (sound seconds), the two go together nicely. After launch we went to the UOSAT lab at south Vandenberg to listen in on the NASA links. There were several requests for info about UOSAT seperation and health, since uosat seperation came out of sight of NASA, no one knew the status. Interest was high, it was obvious that everyone wanted 100% out of this flight. Colin rang up Surrey and got the good news. I pushed some buttons on the console, came up on the link that had last asked for uosat info and said "UOSAT WTR, Surrey ground station reports seperation and good telemetry on UOSAT-2", or some such offical sounding words. To my surprise, the info was almost instantly relayed to another NASA feed by someone, and was announced over the PA system by someone else. Just another indication that everyone viewed UOSAT-2 as an important part of the overall project. We were treated well by all involved.

The beacons were not heard here at the 03:20 Mar 2 pass. We are assuming that the 10 hour beacon program did not get loaded and that Surrey went to bed before updating TM. We will call them again at midnite local time here to get some new status.

I have close to two hours of raw VHS footage, s/c final prep, premate, mate, and launch. I plan to edit it down to 15 min or so at a local facility here to use for VITA PR. Some of you may want a copy of the whole thing. Anyone have any suggestions about how to best do it? $25 ought to cover the cost of a tape and the duping fee, I'll get it done at a place down the street that dubs though high grade 1/2" editting equipment. I'm open to other suggestions. Larry, did you capture the news tonite on tape? Have you heard from CBC about getting copies of their stuff?

Lets hope for beacons tomorrow.

Harold.

UoSAT-2 was commanded to send telemetry from shortly before
LOS at Surrey on Thursday at 22:32:20. We have reception
reports from Japan at 22:53, however the 145.825 MHz beacon
was not heard later in the USA.

Attempts on the first two passes this morning at Surrey to
re-boot the computer and turn on the beacon - or, indeed to
turn it on manually - have failed.

We would be very interested in data and reception reports for
the 145MHz beacon from 22:50 onwards yesterday in order to
attempt to find a cause for this potential problem.

  Roger Peel G8NEF
  Martin Sweeting G3YJO

Subj: Another frame
Martin,

I called up JH7CKF again and received another frame which he
got around 2300 UTC shortly before LOS.

He has sent me hardcopy of all the frames he got this morning.
So, if you want, I'd QSP all of them via this media, perhaps
tomorrow evening.

Most of my coleagues told me that they heard signals up to LOS,
2301 UTC or so. Thus, in terms of output of the beacon, there
wasn't drastic change while UO-11 was within our range.

Miki

Subj: Sleuthing UO-11
I've been doing some calculations to try to pinpoint the time at which
UO-11 went off the air.

Miki reports signals during the entire Japan pass ending at 23:00; I

heard nothing only an hour later. In the meantime, the satellite went through a descending node over the Pacific and an ascending node over the Atlantic. Locations between Japan and east coast USA (me) included New Zealand, eastern Australia, South America and Ascension Island. In particular, ZL1AOX should have had a ~9 min pass starting at 23:11.

Try to canvass anyone you know who might have listened for the spacecraft from these locations and report any results, positive or negative, on this medium. I'm particularly interested in knowing if anything happened at the start of the half-hour eclipse at 23:40:21.

With fingers crossed,

Subj: Mystery narrowing
Thanks to GRATCLIFF, we now have telemetry from 23:10-23:15 UTC, only
about 45 minutes before the non-LOS at KA9Q. I have decoded his frames
and can't find a clue - everything looks reasonably nominal.

Now the next area we need to put out a call for help to is the South
Atlantic region - suitable locations include eastern South America
(e.g, PY, LU, FY7) and Ascension Island. Just a definite positive or
negative reception report would be extremely helpful. Particularly
welcome would be a report from the Falkland Islands - the spacecraft
entered eclipse halfway through a 4 minute pass there.

After thinking about my poll/final addressing proposal some more and talking to some others about it, I think it might be better to use the high order bit (8) of the SSID bytes in the source and destination address subfields for the command/response designation, rather than the next-to-high order bit (7). Bit 8 is used for the H ("has been repeated") indication in repeater addresses, but it currently serves no function in the source and destination fields. Therefore, simply substitute "bit 8" in place of "bit 7" in my proposal. Bits 6 and 7 of all SSID bytes would remain reserved and set to one, thereby keeping open the possibility of using these two bits to extend the SSID field at a later time.

Compatibility with existing implementations of AX.25 should still be maintained, as bit 8 of the SSID byte in source and destination addresses is currently unused and set to zero. The test for whether the remote station follows this new recommendation remains the same - nonequality between the two bit 8's of the source and destination SSIDs. I *AM* assuming, of course, that current implementations mask off the reserved SSID bits and ignore them in address comparisons - I have no way to verify this.

Phil

I've been posting comments on UO-11 on the telemail AMSAT bb.
Rather than repeat the whole thing here, I'll summarize the situation as
I know it.

The last reported UO-11 frames are from Graham Radcliff in Australia.
The last frame he sent me on Telemail was at about 23:15 UTC; this is
about 45 minutes before the no-show at KA9Q. The path of the satellite
between these two times took it over Antarctica and up the Atlantic
Ocean. There was visibility in most of eastern South America, Falkland
and Ascension Islands. In particular, Falkland's pass included the start
of the half-hour eclipse which occurs on each orbit. Anybody know
anyone down there?

I've written a telemetry decoding program in "C" for anyone who wants
it. Harold has a copy and he's bringing it up on his system. From my
examination of Graham's frames, nothing really looks suspicious.
Rather than post it here (the decoded version of his frames is 116K!),
I'll give a summary.

Temperatures were running cool, but not exceptionally so for a
spacecraft, but remember it had been in sunlight for a while and was
about to enter eclipse in about 20 minutes.

The battery was sitting at a stable +6 C, the battery voltage at a
little over +14 with little fluctuations, and all the solar arrays were
producing power (but not at the same time, of course).
The battery charge/discharge current was fluctuating rapidly,
sometimes going slightly negative but usually running at a few hundred
mA positive. The spacecraft was obviously spinning fairly fast as
indicated by the rapidly changing solar array and battery currents.

Regulated voltages looked reasonable. From a phone conversation with
Harold, none of the various currents seemed out of line. The warmest
temperature reading was, of course, the 2m beacon: +16.6C. It was putting
out about 650 mw of RF.

Facet temperatures were cool, ranging from -5C to 0C, except the -Y facet
with a consistent warm reading of +12.8C.

The mode bits were as expected, 1802 computer, nav mag and 2m beacon about the only things turned on. The navigation magnetometer seemed to be producing numbers. No activity was seen on any of the command receivers (but they were drawing supply current). The computer was on, but not commanding the spacecraft. The command watchdog timer was enabled; according to Harold, this timer runs for about 20 days and turns off the beacons if no command is heard from the ground in this time.

I'm stumped.

Phil

Tom (with copy to everyone),
Here's the predicted AOS times for my next pass as derived from all of the UO-11 element sets on hand:

prelim: 14:13:21.7
MH: 14:12:45.1
Nasa 1: 14:15:52.5
Nasa 2: 14:15:53.6
Nasa 3: 14:14:02.5

In particular, that last one (Nasa set #3) looks suspicious. Without a beacon to track, we could very easily be looking at the wrong object.

Larry,
I'm having pretty good luck in decoding those frames you sent me. So far, I can't find a clue - except I'm wondering about the state of the battery charge/discharge line. I can't figure out if it's functioning properly or not, as I see wild excursions. I tend to discount these because the battery voltage is reasonably stable, varying as you would expect due to eclipses and s/c loading. Can you tell me from which parts of orbits these frames are from?

Phil

P.S. If you want any decoded frames, just yell. They're large, though.

Saturday morning news

Just got off the phone with Roger Peal. Last nite they found an error in the
software which was loaded into the 1802 computer that caused the beacon
to stay on only 1/10 the time they thought, thus the second pass had
an 8 minute beacon instead of 80, and the third pass had an hour beacon
instead of 10 hours. Thus there is now a good reason for hearing it
in VK but not in the US. It would have gone off in the south Atlantic.

(Phil, can you compute where it would have gone off? Assume the program
was loaded 2/3 of the way thru the last UK pass.)

This doesn't explain why the beacon won't come back on. A possible
explaination follows. The was a problem with the two meter beacon that
caused it to be intermittent. One of the osc. stages would occasionally
not lock up fast, and the beacon would draw more power than the power
module would allow it to. This limited the current it could get and it
never locked up. The fixed at VAFB was to increase the current limit for
the beacon. The problem never re-occurred. One theory says that when
the s/c got colder, it drew more current during the start up time, and
has locked up again. By the way, all tlm reviewed shows a healthy s/c
that is not too cold for normal operation.

Assuming the 2 meter beacon is locked up, it may be putting out enuff
hash to block the two and 70 cm receivers. It may be possible to hear
this hash with enuff gain on the ground. Can someone with a big
array point it the right place with a spectrum analyiser and look
for dopplering noise?

Roger promises to put a more complete status summary on TM soon, there
TM link in the UK has been down for several hours.

Keep listening.

Harold.

Subj: Oscar-11 status

Sorry for the ominous silence from UoS - our Telemail PSS link has been down for the past day or so. Thanks for the telemetry and phone calls received since launch.

We have discovered a problem in the program which was run on the Oscar-11 computer on orbits 2 & 3, causing them both to turn the 2m beacon off in an eighth of the time intended. No-one commented that the previous report from us saying that the 2m beacon was on for 80 minutes on orbit 2 was incorrect. So on orbit 2, telemetry was transmitted for 10 minutes from shortly before LOS at Surrey, and on orbit 3 for 75 minutes from 22:30:20 until 23:45:20 - just short of the east coast of the USA.

Since we have now a positive reason why the beacon went off late Thursday evening (GMT), our worst fears of a catastrophic failure look less likely. Discussions at Surrey and very recently with Harold, NK6K, suggest that a more plausible explanation is that the 2m beacon, when cold after being off for 7 hours, failed to oscillate properly on power-on. An effect similar to this was seen during the first cold cycle of Thermal Vacuum testing, however the problem was later tracked down and rectified. The cause was a large current surge on power-up causing the power distribution to foldback sufficiently to prevent full power-up.

Discussion of the remedy for this scenario is still in progress, so any suggestions would be gratefully received. Use of the 1.2GHz uplink is a possibility, since the 70cm uplink shares an antenna with 2m. Harold is already looking at whether the non-nominal signals can be received from the 2m beacon using large antenna arrays in the L.A. area.

Subj: UO-11 Report of W4DAQ

I have just debriefed W4DAQ on his observation of this morning. Here are the salient facts as he reported them to me a few moments ago.

His QTH is Demoplis, Alabama.
Using NASA element set #2 he had predicted AOS of 3 Mar 1418 UTC; actual AOS 1423 @ 120 az. Actual LOS at 180 az at 1436 UTC.

Signals heard on 145.825 characterized as very weak; <S1 over S0 floor.

Station comprises KLM 16C, Lunar GaAsFET at antenna, 15 meters foam coax,
 FT-221R rcvr.

Signals had "slight" Doppler. Mack noted sense shift too. At AOS RHCP=LHCP.
 At (approaching) LOS, RHCP predominated.

Mack's telephone number is 205-289-1225.

73 to all, Rip.

To: HPRICE, MSWEETING
CC: AMSAT
Subj: UO-11 Report of W4DAQ, Rev 1
Further discussion with Mack has revealed the following.

First, a correction. His "predicted" AOS and LOS times were based
on the prelaunch, repeat, prelaunch element set from PKARN rather than
the NASA set #2 which I indiacted a few moments ago.
He said that the times predicted by the prelaunch set and the NASA #2
differed by about two minutes.

Second, Mack also had AOS last night. Details as follows.
 1.Predicted AOS (prelaunch elements): 0352 UTC 3 Mar
 2. Actual AOS 0358 UTC 3 Mar at 300 deg az.   LOS @ 0412 UTC 3 Mar.
 3. He added another 15dB of active gain to the circuit with an
    additional preamp in the shack.
 4. He emphasized his certainty that what he was hearing was of space origin.
 5. He further asserted he could detect no modulation whatsoever on the
    "good sine wave" audio he was hearing. It could not be heard in FM
    detection mode. Only SSB.

Martin & UOS team,
I didn't think much of it thursday night, but now that I've
heard that there is a problem, I thought that I'd relay the
info that on Thursday evening EST,(around 00 UTC 2 March)
there was a pretty good aurora going on here in the States.
I was checking out my modem on my weak signal source at 144.1
MHz and heard the LOUD cw QRM from signals out of the Chicago
Illinois area with the very familiar auroral buzz sound.

The last report of signal reception of U-O-11 was around 23:15
UTC in Australia. I wonder if the magnetic activity had any
effect on the bird. Phil mentioned that the navigation magnetometer seemed to be
producing numbers. Might there be a clue in that data?

** UOSAT-2 SPACECRAFT OPERATIONAL STATUS **

4th March 1984 0800 gmt

Following a flawless launch on DELTA 174 from Vandenberg Air Force Base, Ca., UOSAT-2 separated from the launcher at approx 19:11 gmt over Turkey and in range of the Command Station at Surrey. A lengthy series of instructions was transmitted to the spacecraft to establish the initial operating conditions and then the s/c computer was instructed to switch the 145.825 MHz downlink on for 10 secs to check housekeeping data and ensure that outgassing of the beacon did not give rise to corona. The spacecraft responded perfectly first time and good data was received & decoded at Surrey. The 145 MHz beacon was then activated for several minutes, under computer control, and further data gathered which confirmed that the spacecraft was in very good shape. Just prior to LOS at Surrey, the computer was instructed to activate the beacon once more for a further 4 minutes and good data was received as the spacecraft disappeared over the horizon.

On orbit #2 the 145 MHz beacon was re-activated by abreviated computer instructions and the short and long bursts of telemetry repeated - data indicated everything on the spacecraft to be entirely nominal and so the computer was instructed to keep the 145 MHz beacon active in check-summed telemetry at 1200 bps for the next 80 minutes.

The spacecraft arrived at UoS silent (as expected) at AOS on orbit #3 and the short and long bursts of telemetry data process was repeated - data again indicated the spacecraft to be entirely nominal and so the computer was instructed to activate the 145 MHz beacon for the next 10 hrs whilst the spacecraft was out of range of the Surrey station.

With all having proceeded perfectly to plan thus far, the UoS team relaxed (collapsed?) and waited for telemetry reports from around the world!

The first indications that all was not well came from the printer when Larry Kayser wanted to know why he could not hear UO-11 followed by t/m from Phil Karn etc. The UoS Command Team were 'revived' and awaited the first pass of the day, orbit #8. The spacecraft was silent (again as expected) at AOS, however repeated attempts to re-activate the 145 MHz beacon using the s/c computer failed as did direct command. Heated analysis of the situation resulted in the preliminary theory that the 'Watch-Dog' timer (a device that de-activates the 145 & 435 MHz beacons after 21 days if no commands have been detected from the ground - remember UO-9!) may have been incorrectly initialised and thus may have terminated transmissions prematurely. The 'Watch-Dog' can be reset by command and this, and re-activation of the 145 MHz beacon, were attempted on orbit #9 - however with no success. Continued attempts on orbit #10 yielded nothing and things began to look rather grim. At that time no reason could be found for the premature shut-down of the beacon and the

prevailing theories tended towards cataclysm. Additionally, t/m 'went down' and we had to resort to phoning around to gather more pieces of the picture! Data from G.Ratcliffe via phone from Australia confirmed that the spacecraft systems were functioning nominally when he tracked UO-11 just before termination of transmissions. The spacecraft was in very good shape!

Detailed examination of the s/c computer software used during the first few passes shewed that the timing had been in error - the timing clock selected had been running at 8 times that required - resulting in premature shut-down of the beacon on both orbit #2 and #3 entirely in agreement with observations! This now veered the theories away from the 'Big Bang' and towards some sort of spacecraft systems problem.

Lack of feedback from the spacecraft keeps us effectively blind and all we can do is postulate the most likely theories based on pre-launch experience. The current theory is that there may be a problem with the 145 MHz beacon causing it to fail to operate correctly and generate wide-band noise and block the command receivers. This theory is based on observations of the performance of the beacon during test where some problems of this nature were encountered but were later believed to have been fixed. The Surrey Command Station are continuing to attempt to command the 145 MHz beacon OFF and the 435 MHz beacon ON - so far without success. If the 145 MHz beacon is ON but not operating correctly, it should be possible to observe it with high gain antennas and spectrum analysers etc. Should this prove to be the case, then it may be most profitable to attempt to command the spacecraft using the 1.2 GHzcommand uplink as this uplink is the most independant of the VHF/UHF systems.

All we can do is try out various theories - we tend not to favour total system failure or spontaneous detonation at present rather some more limited scenario. We shall keep you posted as to our thoughts and progress. Needless to say, everyone here is somewhat disappointed after the efforts of the last months and such a flawless start to UO-11's life!

We still have faith, though!

Subj: BIG EARS IN THE WEST
Harold Price contacted me this afternoon (Saturday) and requested help with getting one or more well-equipped moonbounce stations on the west coast to look for signals from UO-11. I started with Lance Collister, WA1JXN, in Frenchtown, Montana, and he put me in touch with K6MYC and W5UN. We were fortunate to have all

three stations operational and available to help with the search tonight. That's the good news.

The bad news is that none of them heard any signals from UO-11. Thse are three of the best-equipped moonbounce stations in the West, and if none of them could hear a signal, there was probably no signal to be heard. Their antenna setups and locations are:

WA1JXN, Frenchtown, MT   12 X 19-element Boomers

W5UN, Midland, TX   16 modified Quagis with 26 ft booms

K6MYC, San Martin, CA   8 long yagis with 28 ft booms

All stations are using good GASFET preamps located at the antenna. Predicts were run by W6PAJ using UO-11 element set No. 4, and W5UN also ran predicts using the same element set. The following shows the times of the passes that were checked and predicted maximum elevations (4 March UTC date):

WA1JXN 0300-0311Z (14 deg)   0436-0449Z (79 deg)

W5UN 0255-0306Z (17 deg)   0431-0444Z (38 deg)

K6MYC 0434-0446Z (33 deg)

So, we gave it a good shot and the results are not encouraging. Each station agreed to try one good pass tomorrow morning in hopes that being in sunlight will coax some signal out of the satellite.   They will call me if any signals are heard, and I will notify Harold right away.

We owe each of these operators a big "thank you" for responding quickly and well to our request for help. It was a pleasure to work with them.

Here's hoping contact can be re-established with UO-11. 73.

  Following a flawless launch on DELTA 174 from Vandenberg Air Force Base, Ca., UOSAT-2 separated from the launcher at approx 19:11 gmt over Turkey and in range of the Command Station at Surrey. A lengthy series of instructions was transmitted to the spacecraft to establish the initial operating conditions

and then the s/c computer was instructed to switch the 145.825 MHz downlink on for 10 secs to check housekeeping data and ensure that outgassing of the beacon did not give rise to corona. The spacecraft responded perfectly first time and good data was received & decoded at Surrey. The 145 MHz beacon was then activated for several minutes, under computer control, and further data gathered which confirmed that the spacecraft was in very good shape. Just prior to LOS at Surrey, the computer was instructed to activate the beacon once more for a further 4 minutes and good data was received as the spacecraft disappeared over the horizon.

On orbit #2 the 145 MHz beacon was re-activated by abreviated computer instructions and the short and long bursts of telemetry repeated - data indicated everything on the spacecraft to be entirely nominal and so the computer was instructed to keep the 145 MHz beacon active in check-summed telemetry at 1200 bps for the next 80 minutes.

The spacecraft arrived at UoS silent (as expected) at AOS on orbit #3 and the short and long bursts of telemetry data process was repeated - data again indicated the spacecraft to be entirely nominal and so the computer was instructed to activate the 145 MHz beacon for the next 10 hrs whilst the spacecraft was out of range of the Surrey station.

With all having proceeded perfectly to plan thus far, the UoS team relaxed (collapsed?) and waited for telemetry reports from around the world!

The first indications that all was not well came from the printer when Larry Kayser wanted to know why he could not hear UO-11 followed by t/m from Phil Karn etc. The UoS Command Team were 'revived' and awaited the first pass of the day, orbit #8. The spacecraft was silent (again as expected) at AOS, however repeated attempts to re-activate the 145 MHz beacon using the s/c computer failed as did direct command. Heated analysis of the situation resulted in the preliminary theory that the 'Watch-Dog' timer (a device that de-activates the 145 & 435 MHz beacons after 21 days if no commands have been detected from the ground - remember UO-9!) may have been incorrectly initialised and thus may have terminated transmissions prematurely. The 'Watch-Dog' can be reset by command and this, and re-activation of the 145 MHz beacon, were attempted on orbit #9 - however with no success. Continued attempts on orbit #10 yielded nothing and things began to look rather grim. At that time no reason could be found for the premature shut-down of the beacon and the prevailing theories tended towards cataclysm. Additionally, t/m 'went down' and we had to resort to phoning around to gather more pieces of the picture! Data from G.Ratcliffe via phone from Australia confirmed that the spacecraft systems were functioning nominally when he tracked UO-11 just before termination of transmissions. The spacecraft was in very good shape!

Detailed examination of the s/c computer software used during the first few passes shewed that the timing had been in

error - the timing clock selected had been running at 8 times that required - resulting in premature shut-down of the beacon on both orbit #2 and #3 entirely in agreement with observations! This now veered the theories away from the 'Big Bang' and towards some sort of spacecraft systems problem.

Lack of feedback from the spacecraft keeps us effectively blind and all we can do is postulate the most likely theories based on pre-launch experience. The current theory is that there may be a problem with the 145 MHz beacon causing it to fail to operate correctly and generate wide-band noise and block the command receivers. This theory is based on observations of the performance of the beacon during test where some problems of this nature were encountered but were later believed to have been fixed. The Surrey Command Station are continuing to attempt to command the 145 MHz beacon OFF and the 435 MHz beacon ON - so far without success. If the 145 MHz beacon is ON but not operating correctly, it should be possible to observe it with high gain antennas and spectrum analysers etc. Should this prove to be the case, then it may be most profitable to attempt to command the spacecraft using the 1.2 GHzcommand uplink as this uplink is the most independant of the VHF/UHF systems.

All we can do is try out various theories - we tend not to favour total system failure or spontaneous detonation at present rather some more limited scenario. We shall keep you posted as to our thoughts and progress. Needless to say, everyone here is somewhat disappointed after the efforts of the last months and such a flawless start to UO-11's life!

We still have faith, though!

Martin Sweeting UoSAT Programme Manager

Subj: NOTHING HEARD

I have had no reports of signals heard from any of the morning passes which were monitored by WA1JXN, W5UN, or K6MYC. No further requests will be made for those stations to do more monitoring unless I get an input to do so from those working on the UO-11 problem.
Good luck!

Subj: 'IWI Program Questions

Several people have been asking questions and as a result creating rumors about errors in my prediction program. To dispel some comments/rumors that have been heard in the last day or two:

(1) The program code as it appeared in ORBIT is correct for handling satellites with inclinations > 90 degrees. Any stories to the contrary are wrong.

(2) Two versions of the program ended up with minor typographical errors involving the same line of code. The K0RZ version for APPLE II has an error in about line 330 where the code reads "IF M > 1 THEN ...." ----- the correct code should read "IF M > 2 THEN ...."

(3) N5AHD has reported a bug similar to (2) for the IBM-PC. It is documented on the AMSAT BB but involves a line which reads "IF M > 2 THEN ...." which should read "IF MONTH > 2 THEN ....".

To my knowledge there are no other errors in the code distributed. The code WILL work for UoSAT as it stands. The problems in finding UoSAT are not due to the prediction software. Predictions made here using my "master" copy on North Star agree with KA9Q's predictions made with independently developed software running on a VAX.

73, Tom

- - - - - - - - - -

Attempts to hear using stations with "big" ears (K1WHS, W4DFK), on the east coast have proven negative thru Sat. Nite. Sun. AM attempts at W3IWI (within abt 2 dB of EME capability) have also proven negative. 73, Tom

Subj: To the Big Ears crew.
Please compute the minimum strength signal you would expect to be able to hear from the uo-11 orbit at your station. We would like to try to hear the local rx oscillators on uo-11. Exact frequencies later, but they will be around 134 MHz.

- - - - - - - - -

My comments on Harold's msg: Most of the EME arrays are quite narrow band. They are probably already down 1-3 dB at 145.8 MHz. I hold little hope that they will hear anything 12 MHz = 8% away from their design freq. If this is important, it would be best to try to find some station with a big (e.g. > 30') dish and throw together a special feed. We should also arrange for either Lunar or ARR or ??? to get a GaAsFET preamp done for us quickly. To mount this test will be a fairly big deal. Is it really worth it?

PROPAGATION BULLETIN NR 10 FROM ARRL HEADQUARTERS NEWINGTON CT MARCH 5 1984 TO ALL RADIO AMATEURS

THE SOLAR FLUX DROPPED FROM 174 ON FEB 25 TO 120 ON MARCH 4, AS SEVERAL LARGE SUNSPOT GROUPS MOVED OUT OF SIGHT AROUND THE SUN'S WEST LIMB ON THE 4TH. LEAD SPOTS OF THE ACTIVE AREAS RESPONSIBLE FOR THE FLUX RISE OF FEB 7 THROUGH 10 CAME AROUND THE EAST LIMB AND THE RATE OF FLUX DECLINE SLOWED. VALUES ARE EXPECTED TO TURN UPWARD IN THE NEXT FEW DAYS, BUT READINGS ABOVE 140 SEEM UNLIKELY, AND ANOTHER DIP IS DUE AT THE MIDDLE OF THE MONTH.

LOW GEOMAGNETIC ACTIVITY AND GENERALLY GOOD PROPAGATION ON ALL DX BANDS ARE EXPECTED BETWEEN MAR 5 AND 9, ALTHOUGH LOWER SOLAR FLUX VALUES WILL REDUCE DX ACTIVITY ON 28 MHZ TO SOME EXTENT. THE IMPROVING POSITION OF THE SUN WILL MINIMIZE THE EFFECT OF LOWER SOLAR FLUX, AND THE /MUF/ WILL BE MOSTLY HIGHER THAN PREDICTED IN THE PROPAGATION CHARTS IN QST FOR FEBRUARY. THE SAME SHOULD APPLY FOR MOST OF THE LATTER HALF OF MARCH, THOUGH MORE DETAILED INFORMATION FOR THAT PERIOD WILL BE GIVEN IN LATER BULLETINS.

INCREASED GEOMAGNETIC ACTIVITY AND DEGRADED PROPAGATION IN THE HIGHER LATITUDES ARE EXPECTED AROUND MARCH 10 AND 13 TO 15. RELATIVELY CALM MAGNETIC FIELD CONDITIONS AND GENERALLY GOOD PROPAGATION ARE DUE MAR 169 THROUGH 25 AND 27 TO 29, THOUGH CONDITIONS IN THE NORTHERN HEMISPHERE WILL BEGIN TO SHOW A SEASONAL DECLINE IN LATE MARCH.

AMERICAN SUNSPOT NUMBERS FOR FEBRUARY 23 THROUGH 29 WERE BETWEEN 57 AND 124 WITH A MEAN OF 87.9.

I like the frequency charts that Robert Parness has been posting
for the Naperville, Illinois area - but would like to see a similar
file for the Holmdel, New Jersey area. To help that happen,
I am willing to collect, format, verify (as best I can) and post
sporadically such a file if others on the net will send me
their lists of active frequencies in this area.

Thanks.

<>
In response to requests for a summary of answers regarding
Vacuum Tube Suppliers, here it is:

This sounds stupid but let us not overlook the obvious:
Radio Shack advertises that they can supply any of several 000
types. They don't carry them in their stores but they say they
can order them and get them fast. I recommend the Radio Shack in downtown
Red Bank if you deal with the manager. He is an allright guy.
Dick Grantges hound!rfg

I, along with many others I'm sure, have a stock of vacuum tubes (new and
otherwisw#e) residing in the basement. If you send me a list of your needs
I'll check the stock and see if### what I might have.
                  Regards,
                  Len Kastner
                  aW##Wh X2828
                  clyde!lgk

For a good selection of any tubes, new and old, try here:

Steinmetz Electronics
7519 Maplewood
Hammond, Ind. 46320
(219) 931-9316

Bruce Sabalaskey
ihuxu!kma8080

I have a catalog from "United Page". Judging from the types, quantities, and prices of tubes they carry, it appears they're a surplus dealer.

You can write them at:

United Page
481 Getty Ave.
Paterson, NJ 07503
(201)279-7500 or (212)736-9351

Good luck!
-Tom Kloos, Tektronix, Inc. tektronix!orca!tomk

Sources of vacuum tubes are:

Atkinson & Smith
Lewis Avenue
Eatontown, NJ
(In their upstairs surplus room)

ETCO Electronics Corp.
North Country Shopping Center
Route 9
Plattsburgh, NY 12901
518-561-8700
(I have a copy of their summer 1983 catalog.)

T. W. Thatcher
HO 3D-510
949-4241

I am interested in any replies you get to your inquiry, and unfortunately cannot help you out.
But please post any results you get,

Thanks in advance,
Bob Switzer

I bought a Tek RM45 (like a 545 but rack mount) a while back, and it lost it's CRT during shipping, but I got to keep it. I'd be glad to sell you any of the tubes in it for an incredible price, as I don't really need them.

Several of the tubes (especially in the amplifiers) should be "Tektronix checked". This isn't just a ploy to sell tubes, the tubes have to be matched for grid leak and such factors. If you don't have a curve tracer, or even a dynamic transconductance checker, you can't do this yourself easily. I'll sell you the checked tubes, and as many spares as you want. (I used to deal in Tek 'scopes, and I still have ~400 6CB6 tubes from the *507* series!)

Thought: I'll sell you the whole chassis from the '45, if you want it. It has most of the switches, resistors, etc., that were originally on it, but no CRT. It is rather weathered, though.

<> I've seen a few requests lately for sources of vacuum (receiving) tubes. I did a reasonably extensive search last fall for sources for audio uses, and found one company I'm quite happy with. They have low prices, fast delivery, a large stock list, and low prices. They have Sylvania/Phillips tubes, and probably others, and also semiconductors. This company is Transleteronic Inc., 1365 39th St., Brooklyn, NY, 11218. Two typical prices are 6L6GC $5.25; 12AX7A $2.64.

Another company (which I haven't bought tubes from) is ETCO Electronics, North Country Shopping Center, Plattsburgh, NY, 12901. They say they have a very large tube inventory, and publish a large list.

--henry schaffer ncsu genetics

MANY, MANY THANKS TO THE RESPONDENTS. WE'RE CHECKING OUT THE TEK-551 CRT ON A BENCH-CHECK AND THEN WILL USE THIS INFORMATION.
"SPAM" CAN EXPECT A CALL FROM PHIL NAHSER, W4WUB, SHORTLY.

NOTE: I received a header WITHOUT TEXT from inuxd!rcf dated 24 Feb 84 13:21:27 CST.

Martin,
Last night I had a report from Darryl VK1DF who works at
the Orroral Valley Tracking Station near Canberra.
Two operators believe they have copied signals from UO-B
on a number of occasions.
1. 4.3.84 approx 1235 UTC or time of closest approach
   no carrier but RFI detected and a questionable signal
   on 145.7317 Mhz ???
2. 4.3.84 approx 2300 UTC a clean carrier on 145.825 Mhz
   for about the first half of pass, locked on to and
   measured carrier using 26M dish at -120dBM, then it
   went raspy and RFI sounding and could only be heard
   for a few seconds at a time.
3. 5.3.84 approx 1130 UTC raspy carrier but only for
   3-4 seconds at a time and was -135dBM at point of
   closest approach.
The times are somewhat approximate because the operators
primary task at the time was their work in tracking
Landsat D1. If you want to contact Darryl VK1DF his
home phone number is (062)824380 at home for the next
two days phone number at work is (062)357200

To: amsat
Subj: Orroral Valley observations
A few calculations on the Australian observations:

According to my handy-dandy Satellite Service Calculator (won as a door
prize at the annual general meeting a couple of years ago), the 26M dish
would have a gain of 29 dbi and a beamwidth of 6 degrees on 2 meters,
assuming a feed efficiency of 50%.

Working the reported signal strengths back to the spacecraft, the
received level of -120 dbm corresponds to an EIRP at the spacecraft of
-13 dbm over 1000 km. (That's 1/20 of a milliwatt). -135 dbw
corresponds to -28 dbm over 1000 km, or just over a MICROwatt!

The cosmic noise background behind the spacecraft varied over the course of the pass. At the 4 March 12:35 observation, the apparent position of the spacecraft was 6 hours 30 minutes RA, +23 deg declination; according to a 136 mhz radio sky map, the cosmos has approximately a 450 K effective noise temperature in this direction. This corresponds to a noise floor of -137.3 dbm, or a signal-to-noise ratio of 2 to 17 db in a 3 khz SSB bandwidth. The other passes apparently went in front of much noiser areas of the galaxy (1000-3000K) which would knock the S/N ratio down by 3-7 db. All this assumes that the galactic noise swamps the preamp noise, which is reasonable since a good GaAsFET has a noise temperature of 50-200 K.

The message here is that the hearing conditions appear to be very highly variable, and while the chances for someone with a smaller antenna are obviously worse than with a 26M dish (!), there's still a chance that a well-equipped EME station (20 dbi gain) and good GaAsFET preamp should be able to hear the satellite on some passes. Conventional satellite stations are most likely not enough.

Phil

Subj: More elements

I just called up Millstone Hill and asked if radar cross-sections were available for each of the pieces of 1984-021B. Unfortunately, they can only supply that information for deep space satellites, since they specialize in deep space tracking; for low earth orbits, they can only relay standard NORA element sets. In any event, I got a recent update on UO-11, and just to add to the fun, a set on the Delta 2nd stage.

Satellite: oscar-11

Re: UOSAT-2 signal reports.

We have received several more reports from people who hear various kinds
of trash on 145.825.  This is encouraging.  What we need now is accurate
aos/los times.  We also need some indication of the amount of doppler you
are seeing.  It's ok if you didn't think you heard the whole pass, or if
the signal fades so bad you can't be sure of when aos/los was.  Just
give us what ever you've got, and we'll add gains of salt as appropriate.
We desperately need to make an informed choice from the several element
sets available to us as to which one is uo-11.  We are either too small,
too close, or too silent to be sure.

Give us what ever you've got.  Even doppler (amount of frequency change)
for a short period of the whole pass will help, since no change or too
much of a change will tell us it isn't uo-11.  Spotty aos/los times, if far
enuff out of the expected range, can also tell us we're listening to the
wrong thing.

If you've already sent in a report, please go over your times and resubmit
the report.  If you haven't heard it yet, you may be missing one of the
all time great T hunts.  When we get the beacons turned on again later
this week it will be too late, anyone with a wet noodle will be able to
copy uo-11.

If you're too embarrassed about the poor quality of your data, send it
to just me or Phil.  We won't tell.

Harold.

Guitar Player magazine always contains ads for vacuum tubes --
especially those likely to be found in guitar amps, even
old and obscure ones. The companies usually claim to either
sell matched sets that they have rigorously checked out, and
to weed out less-than-optimal performers. I believe at least
one of the companies claims to have their tubes custom-manufactured
to their own specs. Some of the tubes have extra features, such
as gold-plated pins. The companies that come to mind are
"Groove Tubes," "Mesa Engineering" and "Peavey Electronics."
See an issue of the mag for addresses & details. (Available
at any music store or good newsstand).

QST DE K9EUI
HR DX BULLETIN NR 10 FROM ARRL HEADQUARTERS
NEWINGTON CT MARCH 9, 1984
TO ALL RADIO AMATEURS BT

THANKS TO K1MM, WITRC AND K1XM OF THE SOUTHERN NEW ENGLAND DX
ASSOCIATION FOR THE FOLLOWING DX INFORMATION.

KERMADEC. THE NEW ZEALAND GROUP NOW PLANS TO DEPART THIS
SUNDAY FOR RAOUL ISLAND IN THE KERMADEC GROUP. AFTER A FOUR

DAY OCEAN TRIP, THEY SHOULD BEGIN APPROXIMATELY MARCH 15 OR 16. THE OPERATING CREW CONSISTS OF THREE ZLS AND ONE U.S. OPERATOR AND AT LEAST TWO STATIONS WILL BE USED. A TEN DAY OPERATION IS PLANNED. MEANWHILE, WARWICK, ZL8AFH, IS BECOMING A LITTLE EASIER TO FIND, WITH ALMOST WEEKLY VISITS TO THE VK9NS NET. QSL ALL ZL8 CALLS TO THE CORRESPONDING ZL1 EXCEPT ZL0AJW/8, WHICH GOES TO ZL1BQD. BEFORE AND AFTER THE KERMADEC TRIP, ZL0AJW QSLS GO TO W6REC.

SOUTH SHETLAND. 4K1F HAS BEEN REPORTED EVERY DAY THIS WEEK ON 20 METER SSB. WATCH 14210 TO 220 KHZ AT 0400 TO 0500Z. QSL OPERATOR SANDY TO UQ2OC.

SOVEREIGN MILITARY ORDER OF MALTA. A SIX BAND SSB/CW OPERATION WILL TAKE PLACE THIS WEEKEND FROM SMOM. THE OFFICIAL STATION, 1A0KM, WILL BE OPERATED BY I0JX, I0IJ, I0MGM AND OTHERS. THE OPERATION IS EXPECTED TO BEGIN EARLY ON SATURDAY AND LAST THROUGH LATE SUNDAY. QSL AS USUAL TO I0MGM.

160 METERS / WARC. ON FEB. 22, ITALIAN OPERATORS RECEIVED PERMANENT PERMISSION TO OPERATE ON 160 METERS AS WELL AS ON THE 18 AND 24 MHZ WARC BANDS. THE 160 METER ALLOCATION IS 1830 TO 1850 KHZ, BOTH CW AND SSB.

THE TOKELAUS. DL1VU IS STILL ACTIVE FROM THE TOKELAU GROUP AS ZM7VU. KARL HAS A VERY STRONG SIGNAL ON ALL BANDS BUT PREFERS 80 AND 40 METER CW.

MALAWI. LES, 7Q7LW, PLANS TO REPLACE HIS 80 METER ANTENNA SHORTLY. WATCH FOR HIM AROUND HIS SUNRISE ON CW. MEANWHILE, LES CAN BE FOUND ON TUESDAY EVENINGS AT 21292 KHZ. QSL TO BOX 24, MTAKATAKA.

EASTER ISLAND. THE YASME EXPEDITION IS PRESENTLY AT EASTER ISLAND SIGNING W6KG/CE0. LLOYD AND IRIS WILL STAY UNTIL MARCH 16, AFTER WHICH THEY WILL RETURN TO SANTIAGO. THEIR PLANS ARE TO IMMEDIATELY DEPART FOR JUAN FERNANDEZ FROM SANTIAGO SO WATCH FOR THEM FROM /CE0Z ABOUT MARCH 18. QSL AS USUAL TO YASME FOUNDATION.

CLIPPERTON. AS OF INFORMATION RECEIVED TODAY, THE FRENCH/AMERICAN GROUP PLANS TO DEPART FROM MEXICO TOMORROW, WITH ARRIVAL AT CLIPPERTON SLATED FOR MARCH 15 OR 16. A SIX DAY SIX BAND OPERATION IS EXPECTED, USING CALLSIGNS FO0XU THROUGH FO0XZ, A DIFFERENT CALL FOR EACH BAND.

LEBANON. DESPITE GROWING POLITICAL TENSIONS, TED, OD5LX, REMAINS ON THE AIR. WATCH FOR HIM JUST AFTER HIS SUNRISE, 0300 TO 0500Z, ON 20/40/80 METER CW ONLY. QSL TO SM0GMG.

SPRATLY ISLANDS. CONFIRMATIONS RECEIVED FROM 1S1CK WILL BE CREDITED FOR DXCC BEGINNING WITH THOSE DXCC APPLICATIONS RECEIVED ON AND AFTER FEBRUARY 1, 1984.

DXCC. A REMINDER THAT MARCH 30 IS THE DEADLINE FOR DXCC HONOR ROLL SUBMISSIONS AR

Just in case there are people on the net who do electronic repairs, testing, or just fiddling around on something other than digital circuitry...

I have been perusing the mail-order electronics equipment catalogs and have noticed a curious discrepancy. You can buy cheap audio signal generators, cheap frequency counters, cheap multimeters, and various other low-cost gear, but it seems there is difficulty in buying a reasonably-priced RF signal generator! Does anybody know why this is so?

It seems to me that it should be little more difficult to build an RF signal generator than an AM radio; the circuits have much in common, as the oscillators in a superhet essentially do the same thing. Accurate dial calibration and linearity should be the main cost factors, but, with cheap counters being sold by every electronics outlet, who needs such accuracy in the generator dial any more? I have a decent counter, and I need an RF generator to do occasional alignments on shortwave and FM radios. Heath makes the only low-cost (kit) RF generator I have found; the IG-5280, at $47.95 less the ubiquitous 10%-off coupon. It runs on batteries, or requires a separate power supply (which powers a set of 5 different instruments in this series). Does anybody have any comments on this device? Are there any other low-cost, solid-state RF signal generators available out there, either kit or assembled?

I know I really would do best to frequent hamfests and probably would find one there, but circumstances make that impracticable. I have tried to read the QST classifieds, but haven't seen anything like this advertised. Advice and comments solicited.

Will Martin

I tried posting this answer to the inquiry about sources of vacuum tubes
when the question first came out on net.ham-radio, but the postnews
software on this host was not working, unbeknownst to me -- items were
posted locally but not transmitted.

So here it is, late but still applicable...

The best and cheapest source of surplus and hard-to-find tubes that I've dealt
with has been Fair Radio Sales, in Lima, Ohio -- look for their tiny little
display ads in CQ and other ham & electronic magazines. Their catalog lists
a lot of older tubes, and they can supply some not in the catalog -- write
your wants. Prices are very cheap, especailly for used/tested tubes, and
they have a lot of neat stuff in addition.

Subj: Possible UO-11 sighting in ZL.
Hi Martin,
I have a report from ZL1TKL in Tokoroa via ZL1MO of possible UO-11 sightings. Times agree with NASA set #5.

6th March: 0849 UTC strong noise heard on 145.8227 brg 140 dg T.
0853 brg 120 dg
0856 brg 115 dg - a burst of high speed cw or tlm heard, but very weak. Lasted about 10 secs over 50 sec. period.
1026 some noise detected, 1031 noise heard, 1035 noise & 1037 much weaker.

8th March: Freq. 145.8231 at 1148 UTC - short period of about 1 minute, heard weird cw or tlm.
ZL1TKL station: Rx is IC260A with B108 preamp. Ant is 23 elements horizontal with est. 16db gain.
I have asked that he monitor and record any further sightings.
If any uplinking required from S. Hemisphere, I can make arrangements for an EME station to help, especially on 435 MHz.
Vy 73 de ZL1AOX.

From: MSWEETING
To: AMSAT
Subj: Oscar-11
News from Surrey this week re Oscar-11 is still mainly disappointing. No further commands have been accepted from the Guildford command station and commands from Los Angeles on 1.2GHz have not been successful either.

A major source of hope has, however, been reported from Australia, where a NASA tracking station has reported hearing signals on 145.825 MHz at the times when UoSAT-2 was expected. These signals appear to centre around the correct frequency and exhibit the correct doppler shift, although we would expect modulation other than the steady carrier or rasping sounds reported.

We would appreciate other well-equipped stations listening on the Oscar-11 downlink frequency for any possible signals. A record of doppler and frequency measurements, together with

times of signal, from another station outside Australia would
be especially conclusive. Attempts are being made to organise
a large listening session at an installation in the U.K.,
however this is unlikely to take place for up to a fortnight.

  Since any concrete signal reports from around the world will
be positive evidence that Oscar-11 is still alive - if silent
- we are still eagerly awaiting your efforts.

  Roger   University of Surrey.

Subj: Sucessful Packet Radio Gateway Activity Last Weekend
It gives me great pleasure to QSP the following msg -- you can't know
how exciting it was to be involved in the first Packet Radio Gateway
test (especially since AO-10 was at 1 degree elevation for me when we
did it!). -- Tom

                  - - - - - -

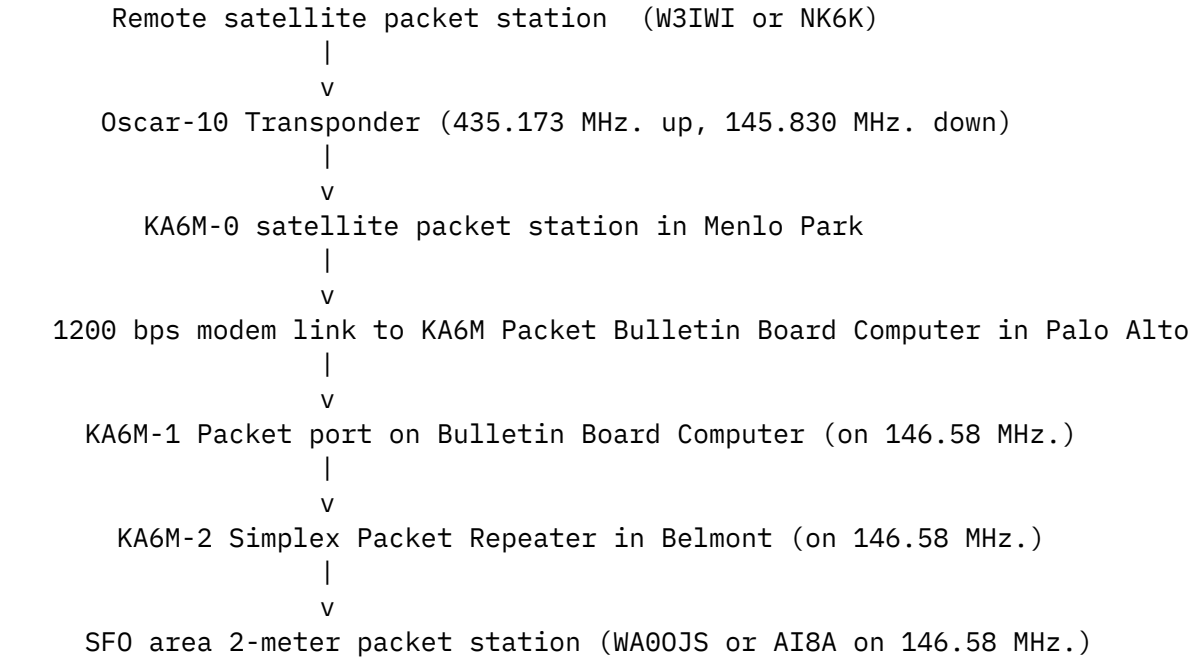
To: All packet radio stations
From: Hank Magnuski, KA6M
Subject: Oscar-10 Packet Gateway (Teleport) Experiments

On Sunday, March 11th, on orbit 560 of AMSAT/Oscar 10, KA6M in conjunction
with the following stations, successfully demonstrated the interconnection
of two packet radio stations with intermediate links using a terrestrial
packet repeater and two AO-10 groundstations. This is probably the first
all digital interlink experiment performed on the AMICON channel.
Those involved were

    Tom Clark, W3IWI, Clarksville, MD   (Washington, DC area)

```
    Hank Magnuski, KA6M, Menlo Park, CA    (San Francisco area)
    Harold Price, NK6K, Redondo Beach, CA  (Los Angeles area)
    Jim Tittsler, AI8A/6, Los Gatos, CA    (San Francisco area)
    Ron McMurdy,WA0OJS/6, Monterey, CA     (San Francisco area)
```

The first contact at 19:00 UTC was between W3IWI and WA0OJS. Tom was working with a very low-on-the-horizon pass, had limited time, and so only a short fragment of text made it in both directions. About an hour later, at 20:05, NK6K successful chatted with AI8A for about ten to fifteen minutes, in what almost seemed like a local QSO. In both connections the intermediate links looked like this:



Remote satellite packet station (W3IWI or NK6K)
Oscar-10 Transponder (435.173 MHz. up, 145.830 MHz. down)
KA6M-0 satellite packet station in Menlo Park
1200 bps modem link to KA6M Packet Bulletin Board Computer in Palo Alto
KA6M-1 Packet port on Bulletin Board Computer (on 146.58 MHz.)
KA6M-2 Simplex Packet Repeater in Belmont (on 146.58 MHz.)
SFO area 2-meter packet station (WA0OJS or AI8A on 146.58 MHz.)

On both contacts text was transmitted in both directions. Error-checked AX.25 connections were maintained between the two satellite stations and between the computer's packet port and the outlying users. However, over the modem link only text was transmitted, and no packet protocol was employed. Equipment included a mixture of TAPR and VADCG terminal node controllers. A total of five TNCs had to be properly connected for all this to work.

Not suspecting that anything special was going on, Ron and Jim connected to the computer system expecting to pick up their mail. Instead, they found that they were connected directly to stations in remote geographic areas, and the packets they were getting were coming from outer space. No one was more surprised than I was when the first text started to come through.

Hopefully, it won't be too long before this kind of operation becomes routine.

73, Hank

I've had a few tube type Heath RF signal generators. They drifted and tuned very coarsely. For fine tuning, I varied the distance between the generator and my hand (ala "hand capacitance").

I too am curious about the newer solid state Heath generator, although I am not curious enough to buy one.

The AN/URM25 and 26 series of military sig jennies are decent. Although they have AM/CW/PULSE output only, the output is much closer to sinusoidal. Cheapies have perverted output waveforms so the harmonics can be used on the higher frequencies. I have a 26 made by Boonton. It was a hamfest special at $15. I rewound some coils and installed a tube (the last owner didn't realize that the oscillator tube was missing!). Unfortunately, the bolometer assembly is defective, so the output calibration circuit is inoperative.

The Precision Apparatus (forerunner of B&K Precision) E200-C is often found at hamfests. It's an old model, with tubes. My $15 was well invested. It's much better than its Heath and Eico counterparts. It was made for real (?) techs, and has a good amount of shielding in its inner construction.

The E-200D is B&K's solid state replacement. I've heard second hand that this unit drifts a lot for a solid state generator. It's always priced over $100 at

the local
fests, usually much more.
